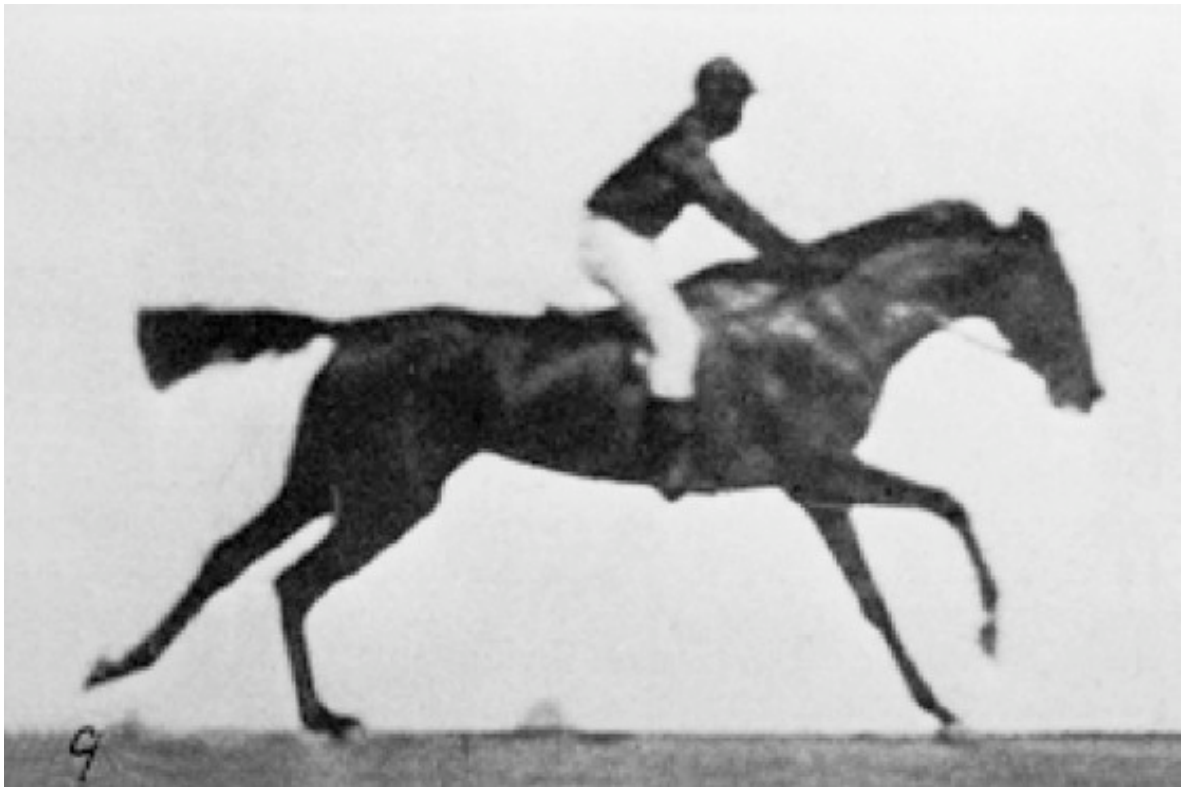
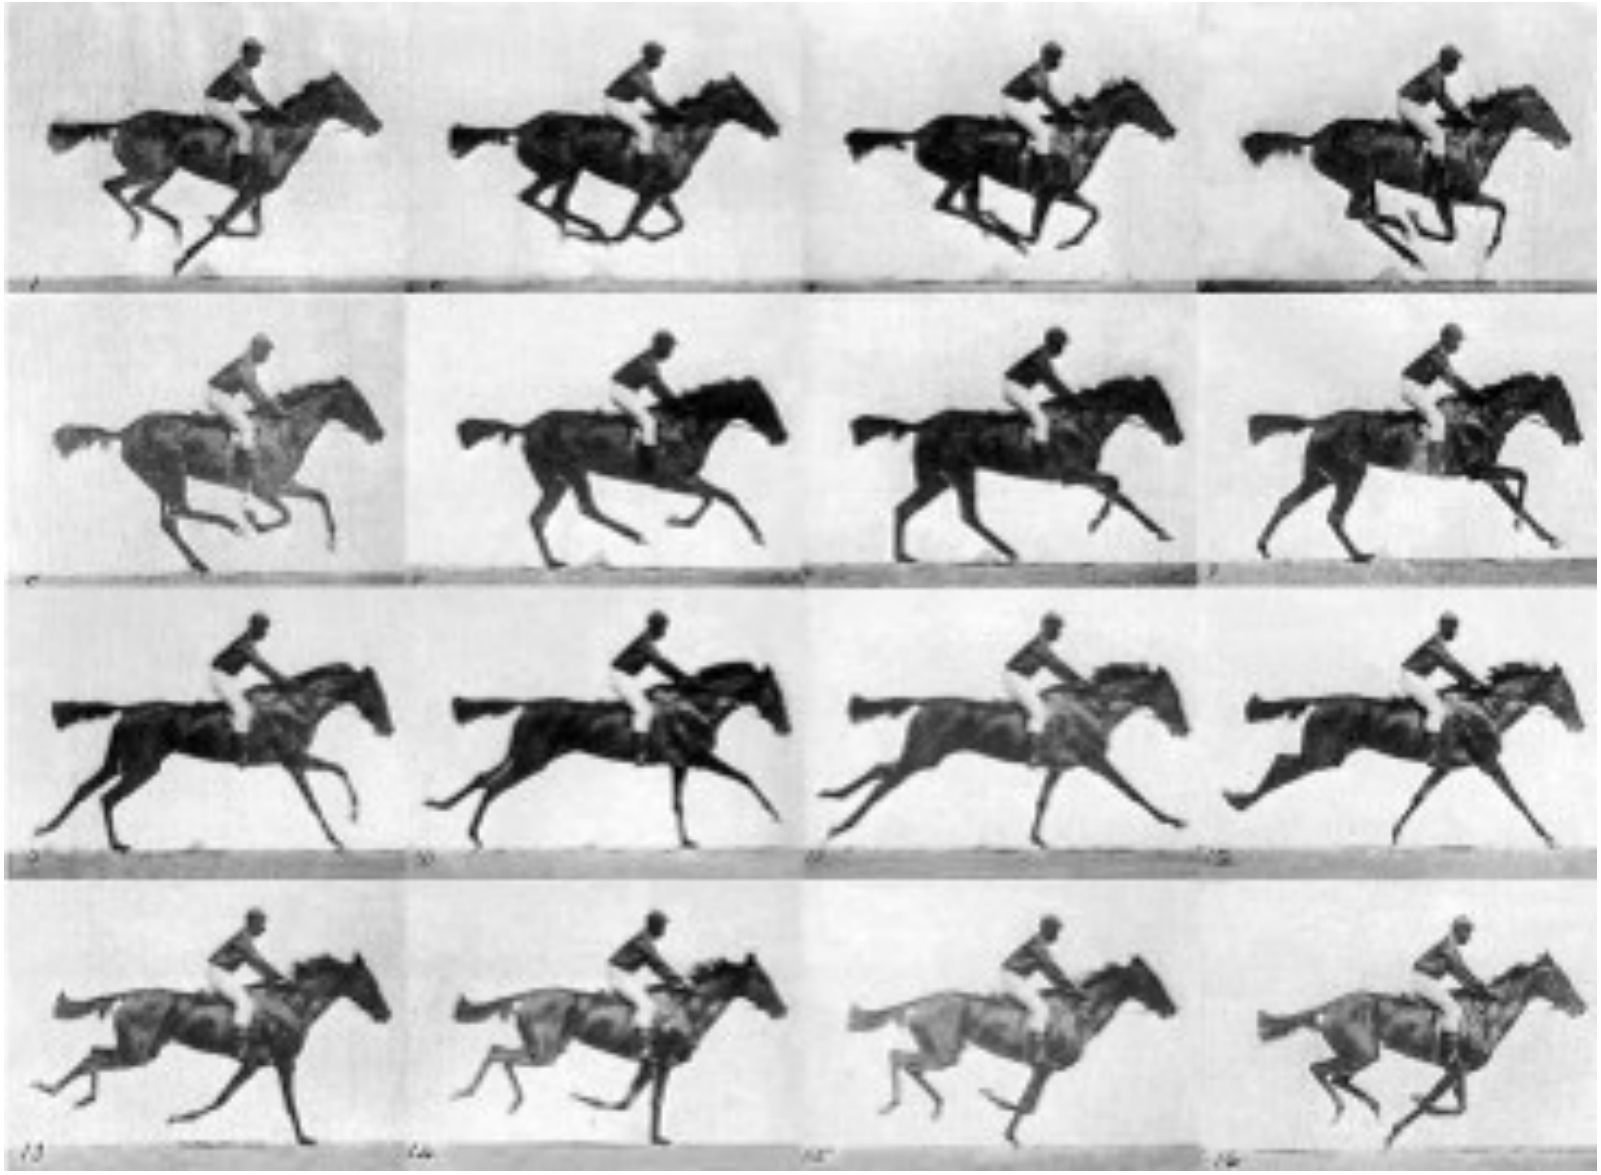
Challenge in 1878:

Structure and dynamics of a horse in motion



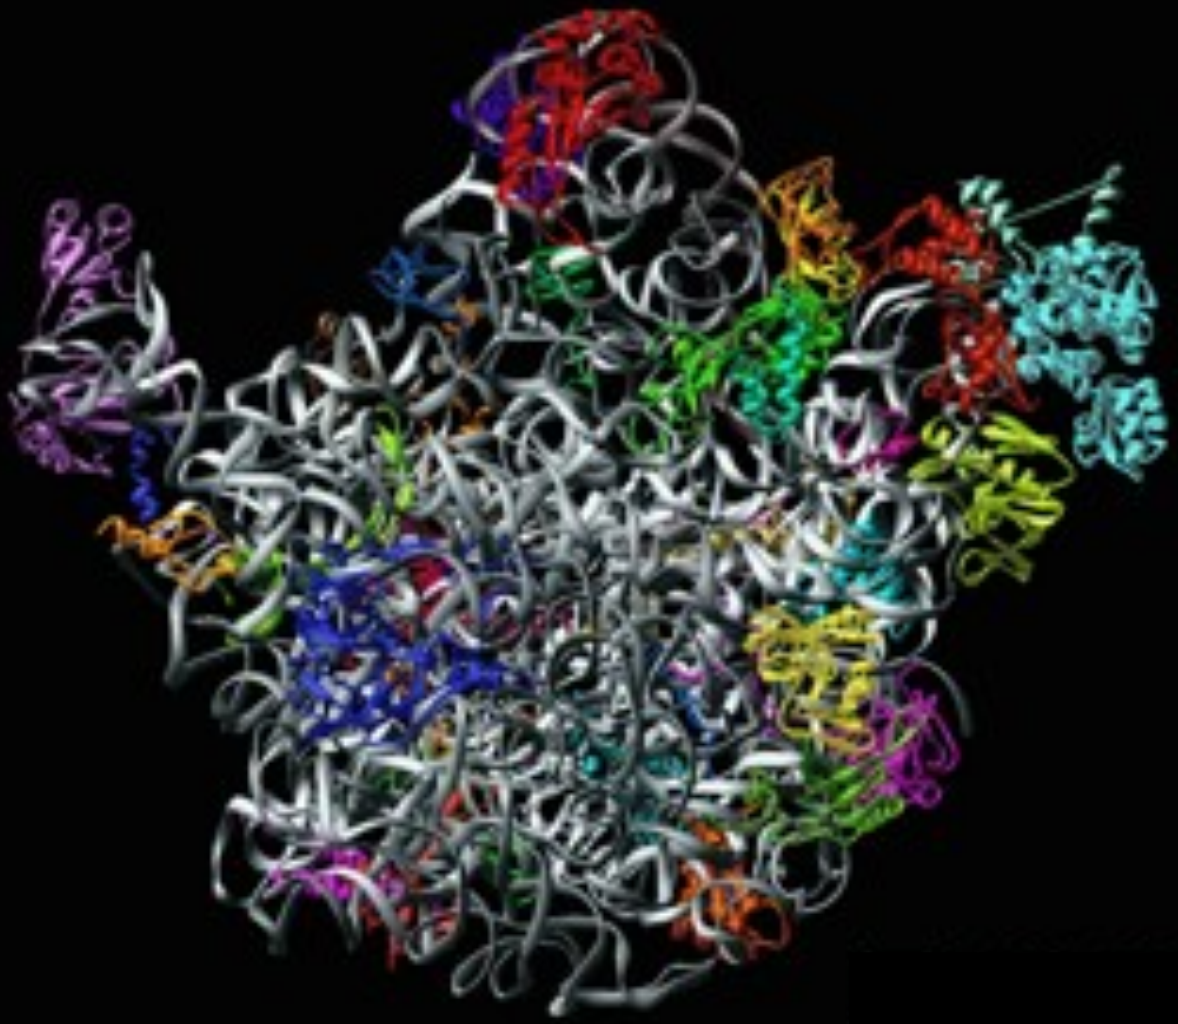
Are all four of a horse's hooves off the ground at the same time ?

Eadweard Muybridge, Sacramento, California



Eadweard Muybridge, *The Horse in Motion*

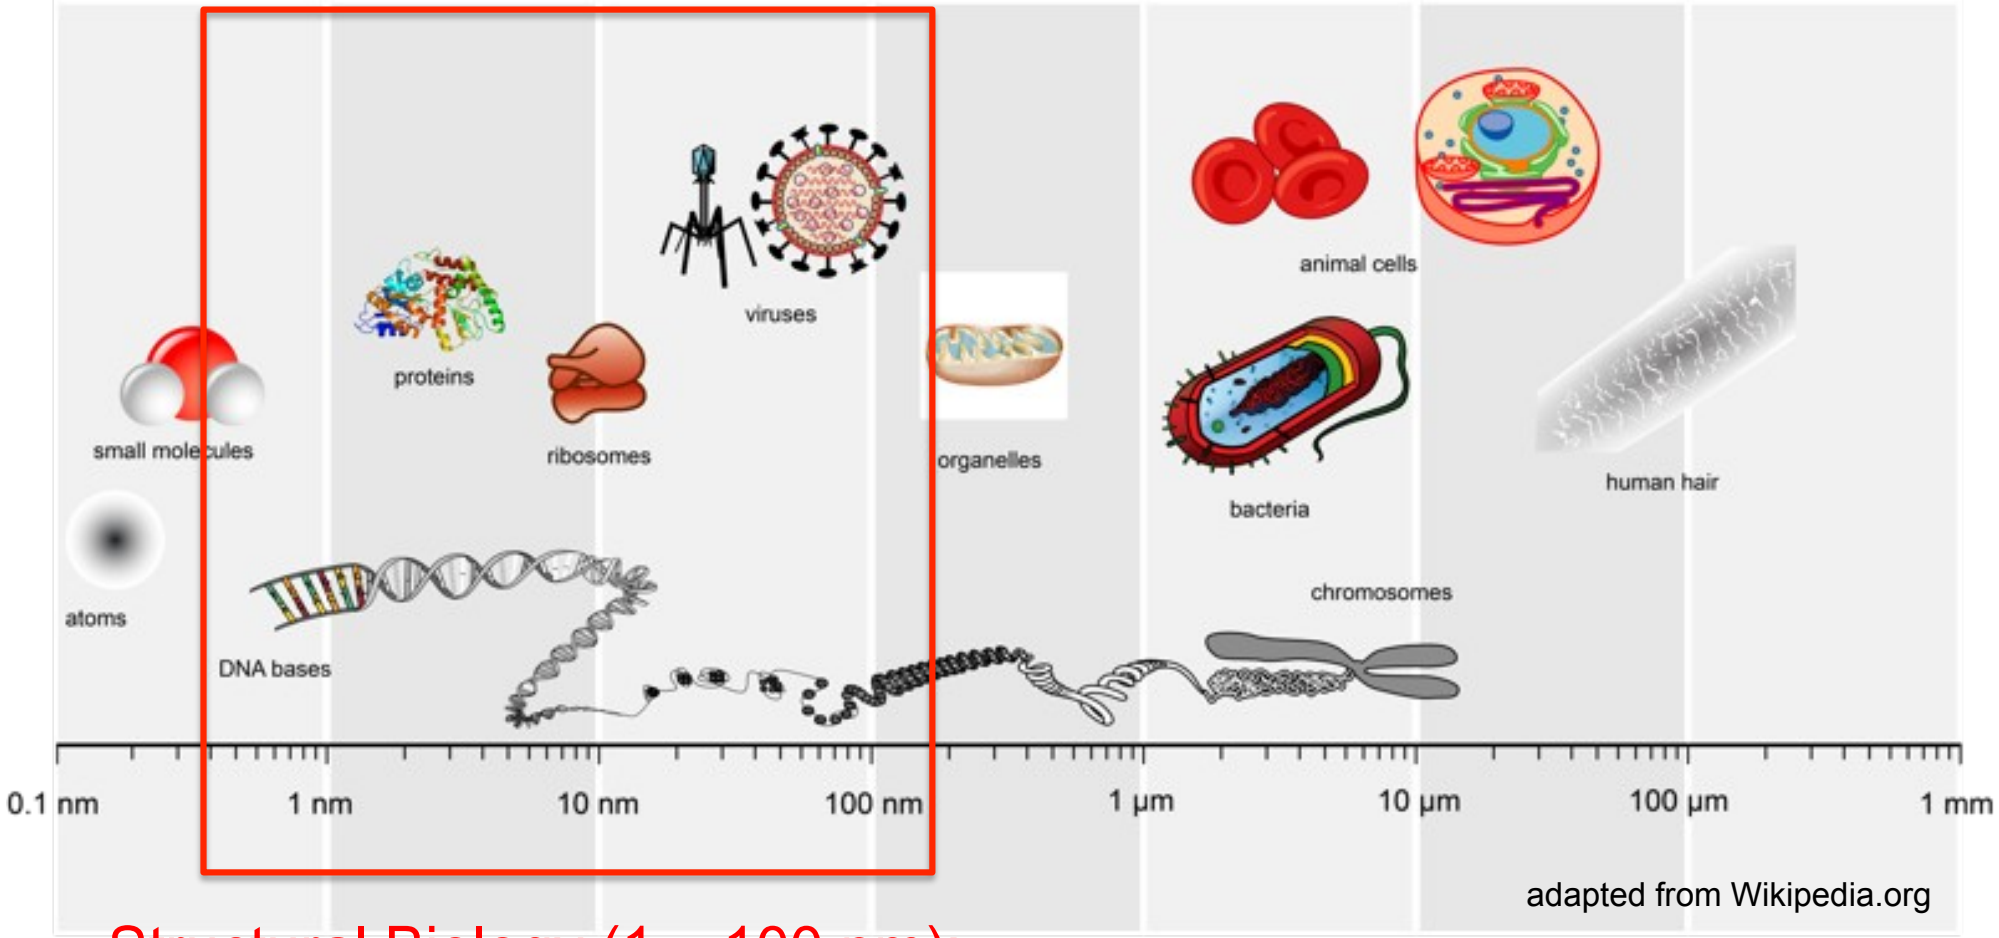
Today's Challenge: Structure and dynamics of single biomolecules



Ribosome: Harms, …. & Yonath (2001) Cell 107, 679

Opportunities for using X-ray Free electron Lasers in Structural Biology

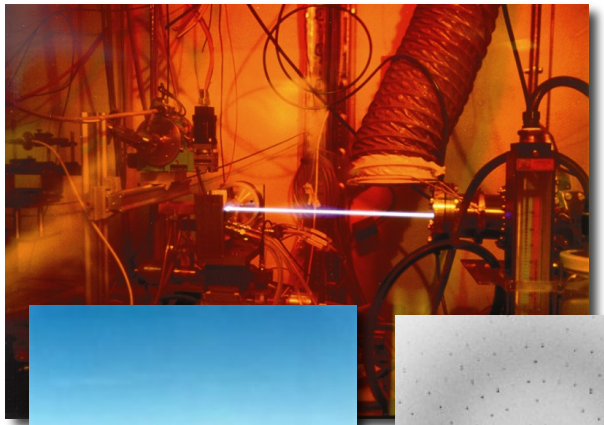
Length scales in biology



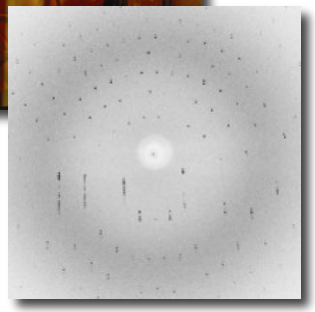
Structural Biology (1 – 100 nm):

The study of the structure and dynamics of biological macromolecules (proteins, DNA, …) and their mutual interactions to understand their function in a biological cell

Protein structures can be determined at atomic resolution by:



X-ray crystallography



90% of the
100 000 structures
in the Protein Data Bank

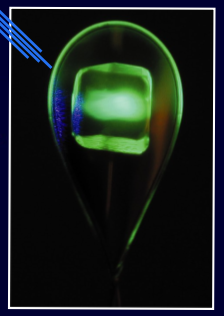
1 Å

Cryo (100 K)



100 μm

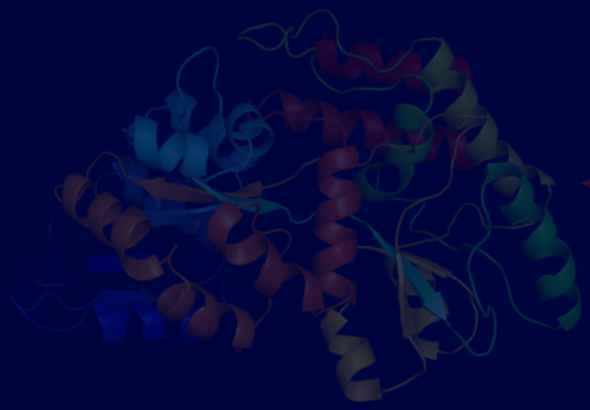
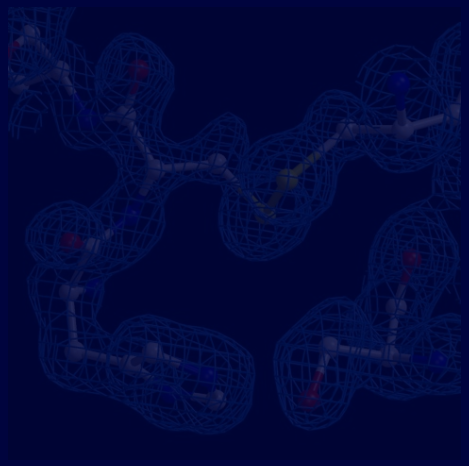
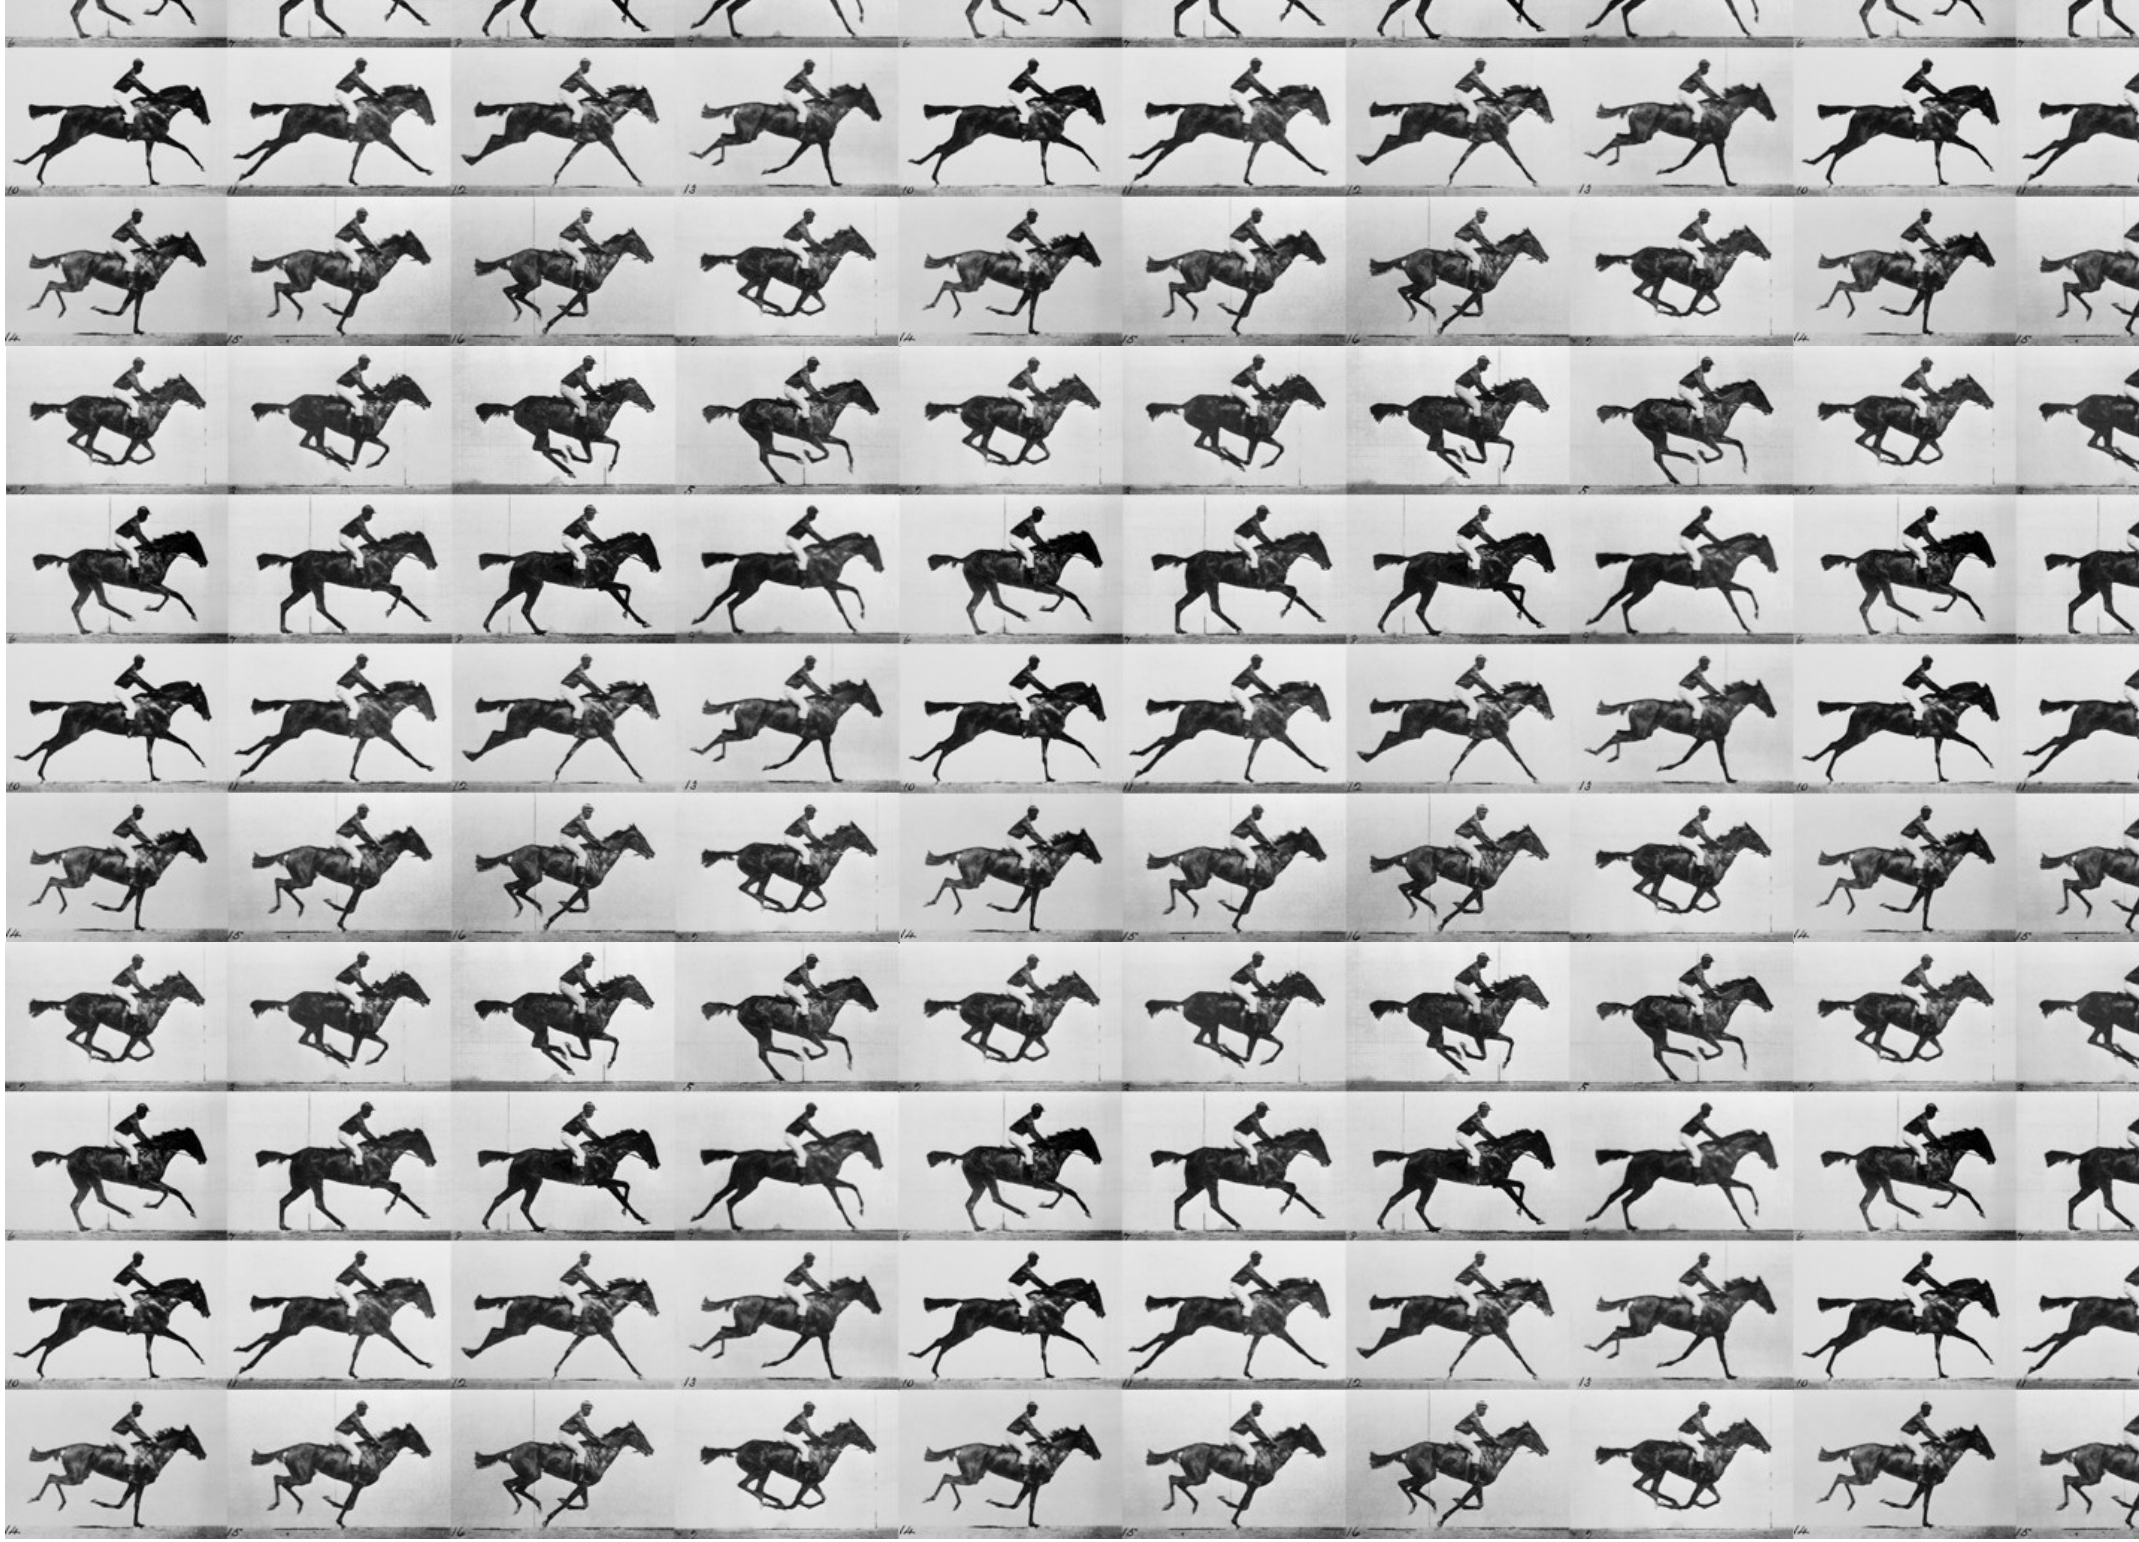
Protein crystal:
10^{15} molecules

- provides average structure





+ phase info

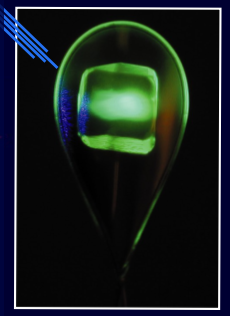


refined model: average structure

... CONVENTIONAL X-RAY CRYSTALLOGRAPHY

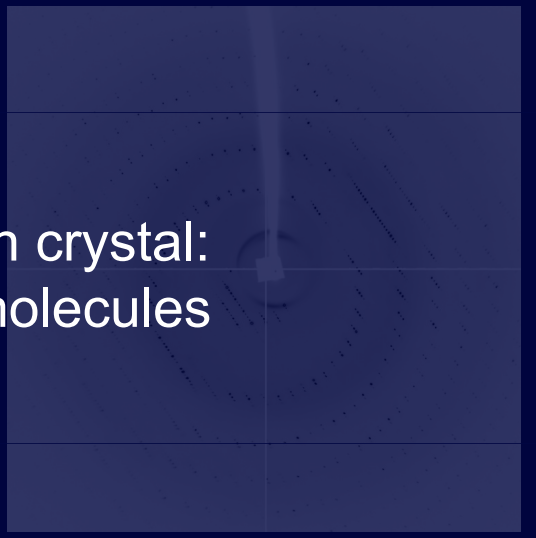
10 keV
1 Å

Cryo (100 K)



100 μm

Protein crystal:
10^{15} molecules



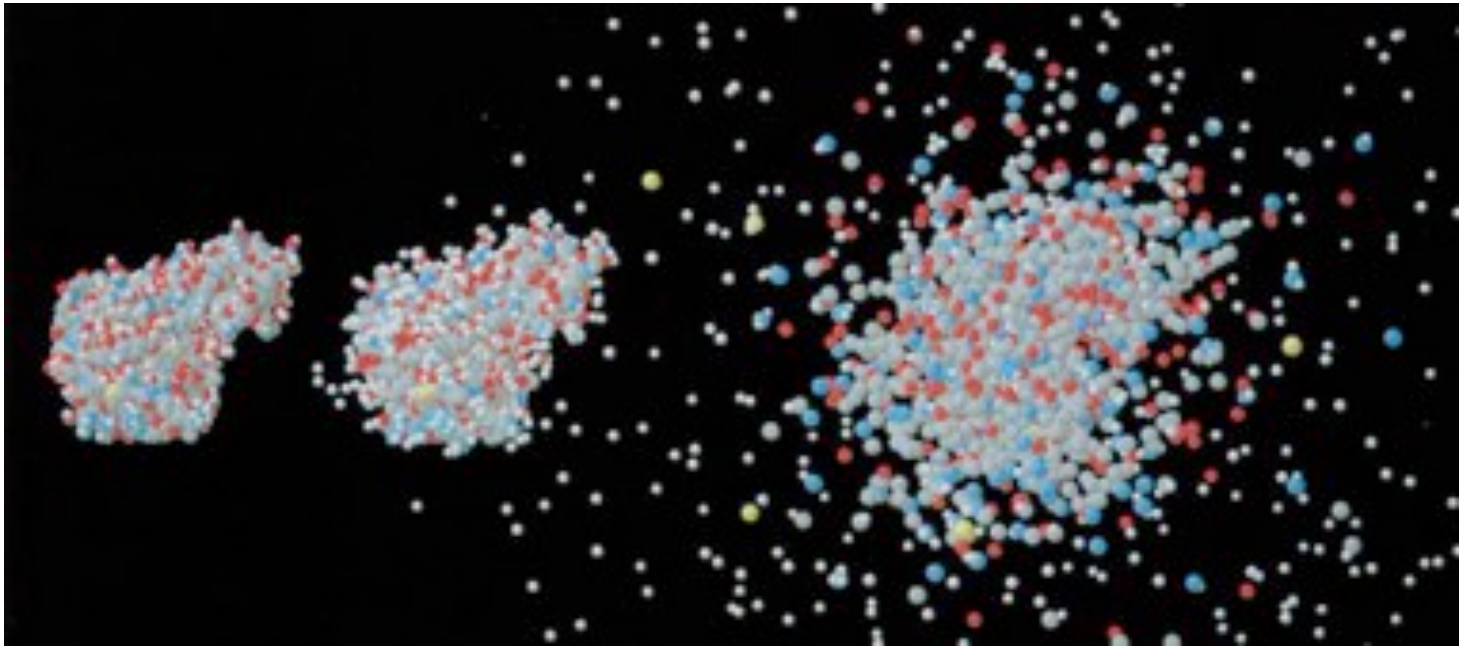
+ phase info

- provides average structure
- needs (large) crystals: problematic for complexes, membrane proteins
- structure determined at non-physiological temperature (100 K)
- chemical and structural X-ray radiation damage
- time-resolved crystallography limited to 100 ps resolution

Would be great to obtain atomic resolution structures from single molecules - no crystals needed

Coherent diffraction imaging (CDI) on single molecules using ultra-short intense X-ray pulses

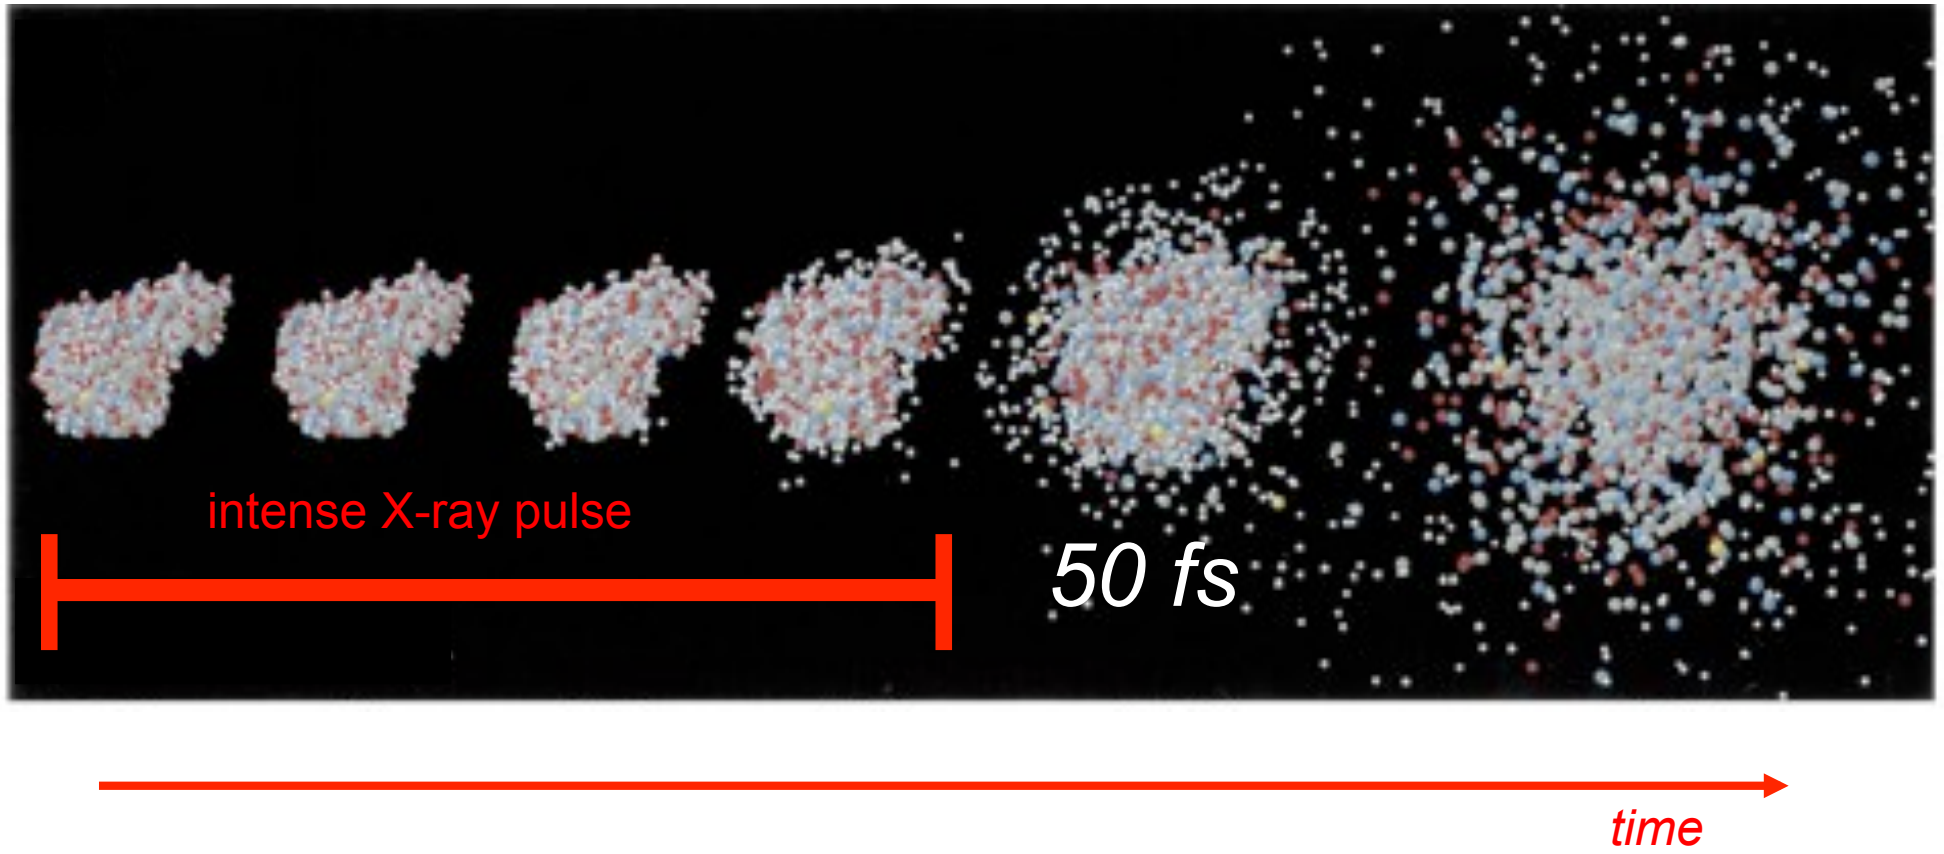
Single biomolecule hit by intense X-ray pulse



1) X-ray photons ionize atoms
2) Photoelectrons leave biomolecule
3) Protein gets more and more positively charged
4) Coulomb explosion after about 50 fs

Diffraction-before-Destruction Imaging

Idea: Neutze et al. (2000) Nature 406, 7524

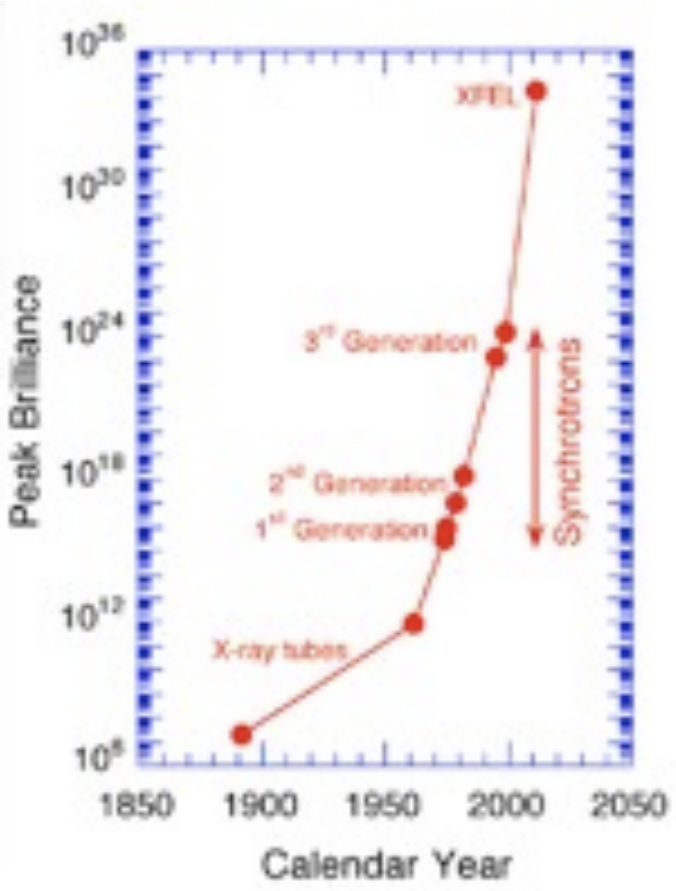


Collect data before the sample has time to respond (explode)

Diffraction-before-Distruction Imaging

needs

enormeous X-ray flux (brilliance)



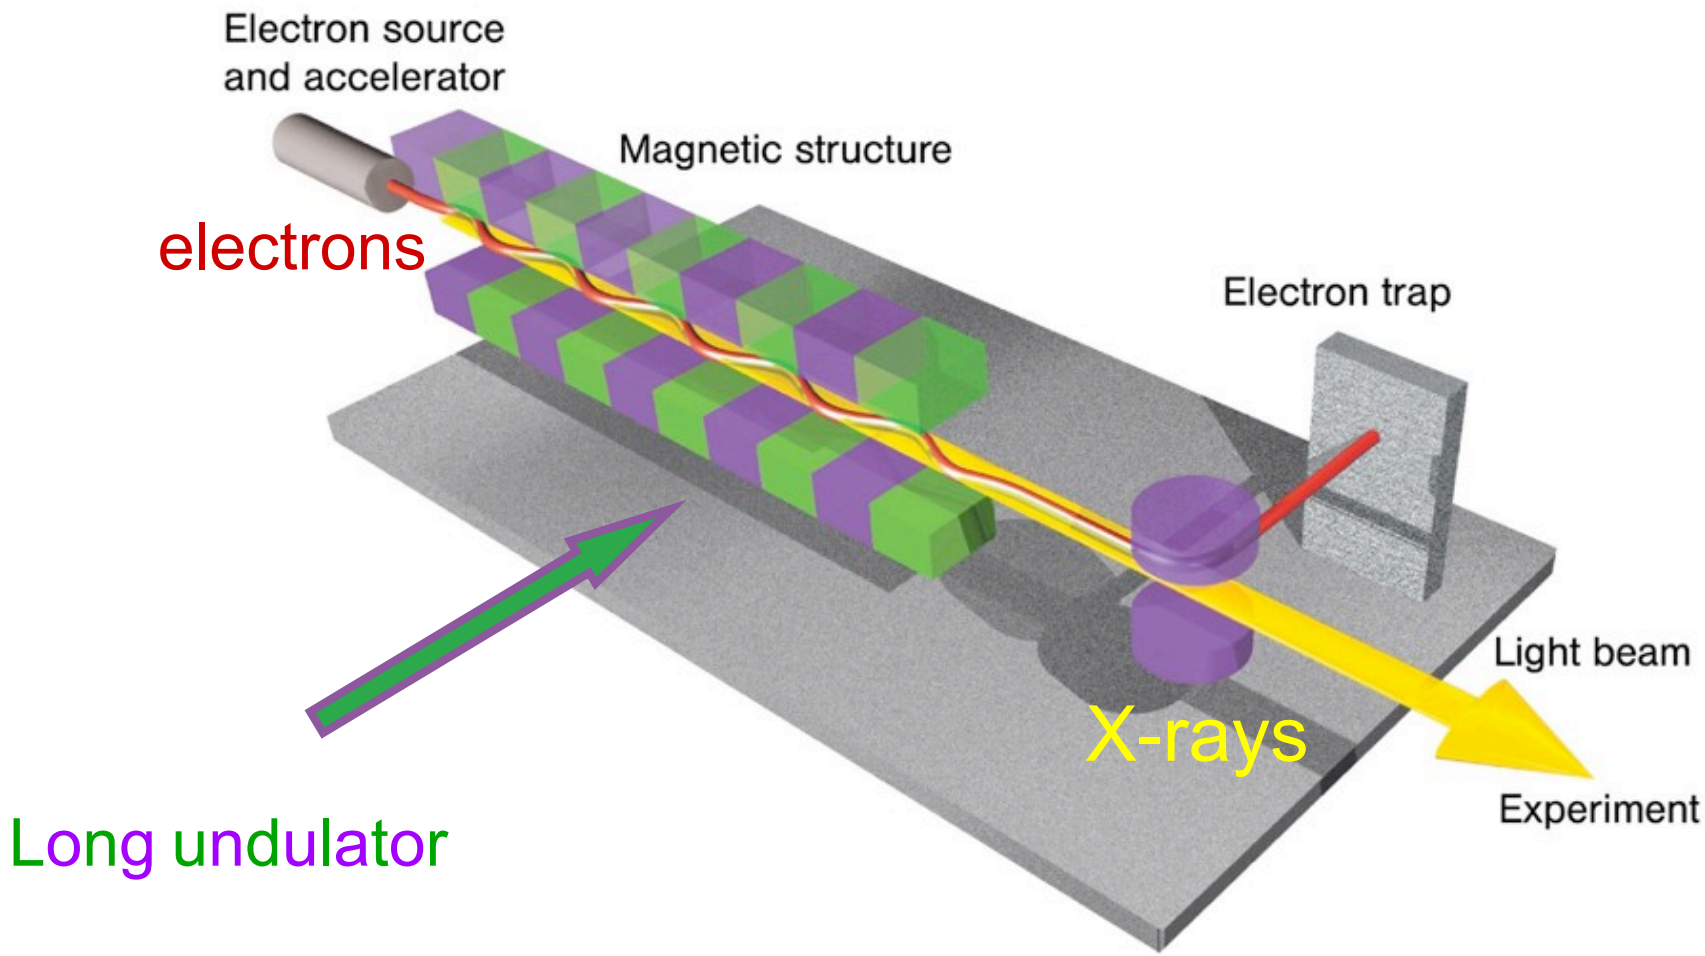
Solution:

X-ray Free Electron Lasers

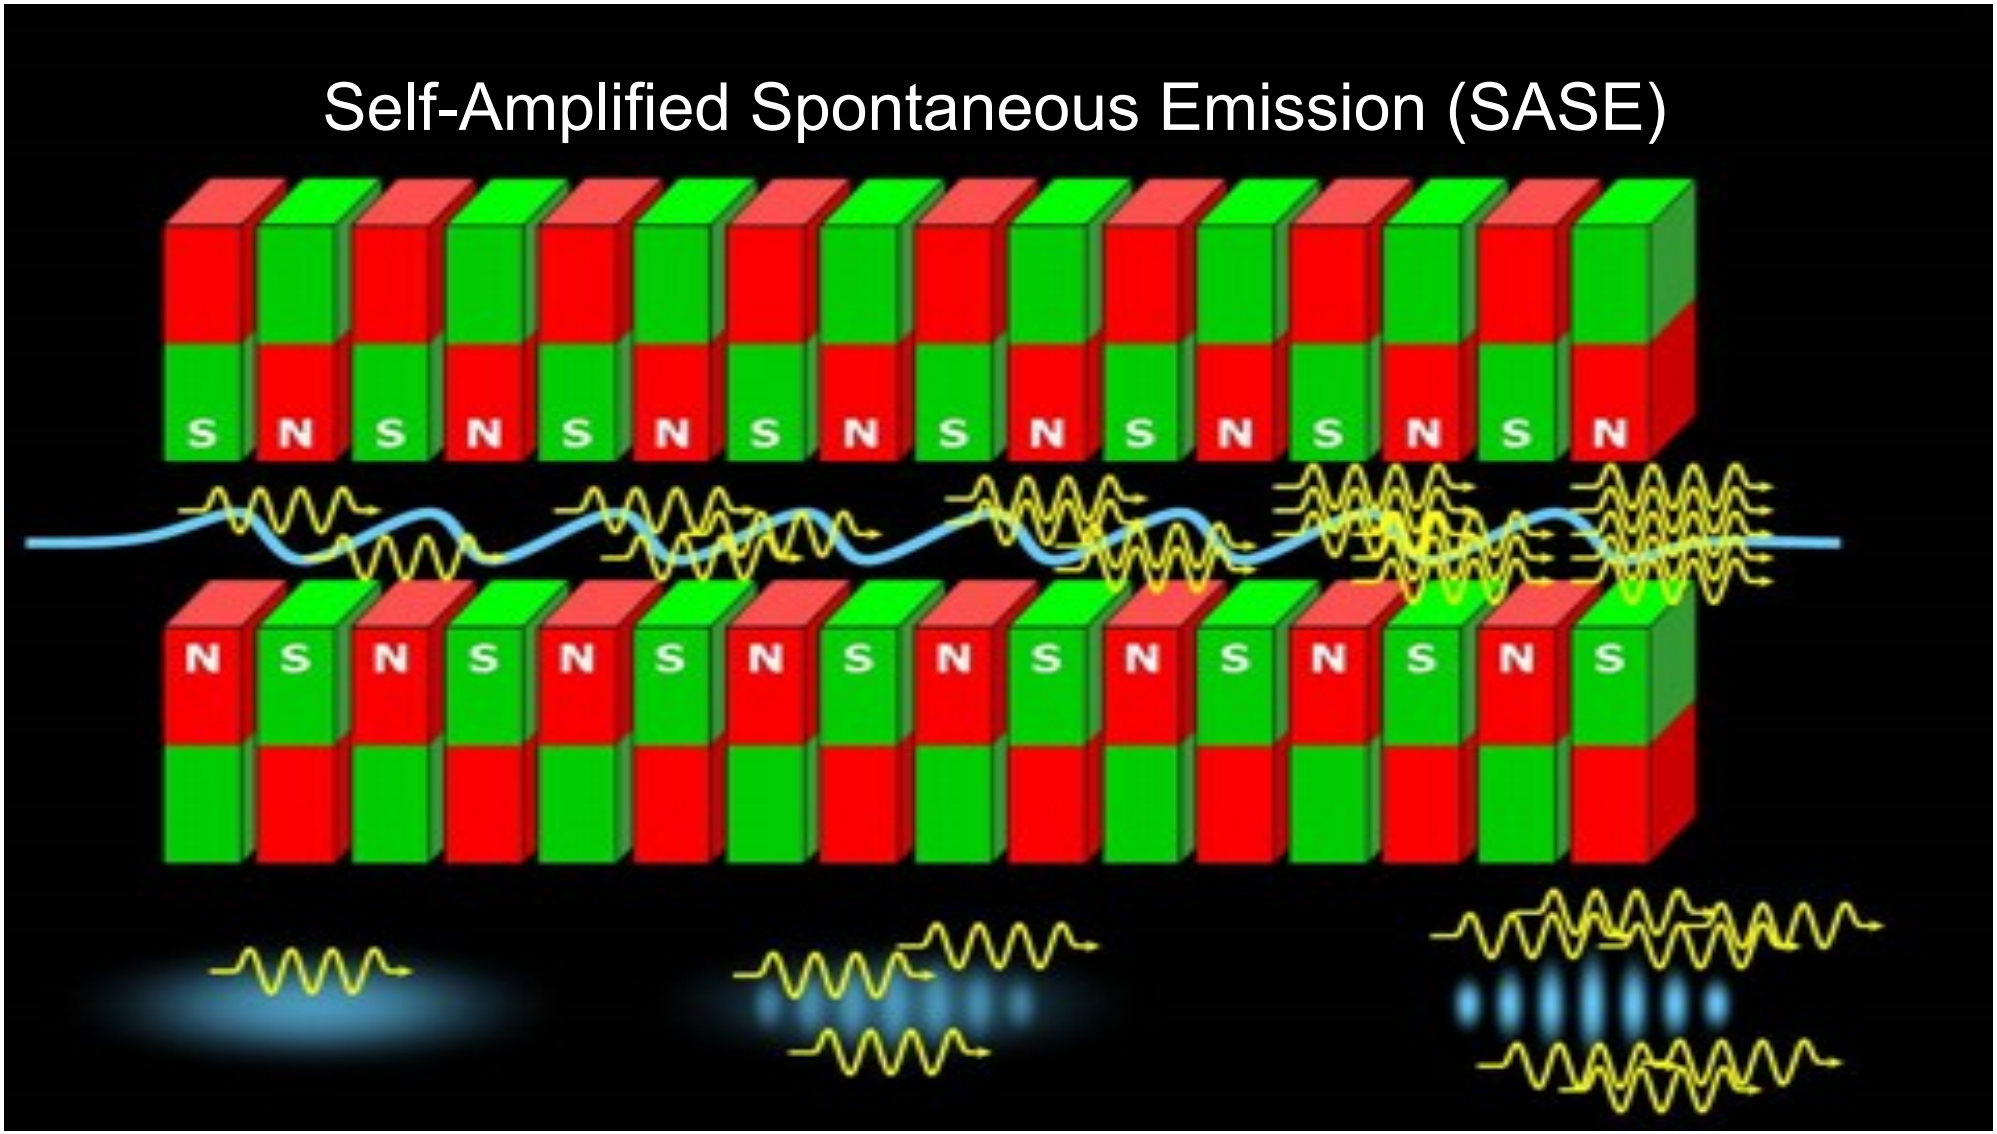
XFEL have 10^{10} times more peak brilliance than ESRF

Free Electron Laser

Idea of FEL: J. M. J. Madey (1971) J.Appl. Phys.42, 19061



Simplified description of XFEL: Margaritondo & Rebernik (2011) JSR 18, 101



SASE in long undulator (100 m) leads to micro-bunching of electron macro-bunches

Micro-bunches are separated by a distance equal to one radiation wavelength:

Coherent wave is emitted with very high brilliance

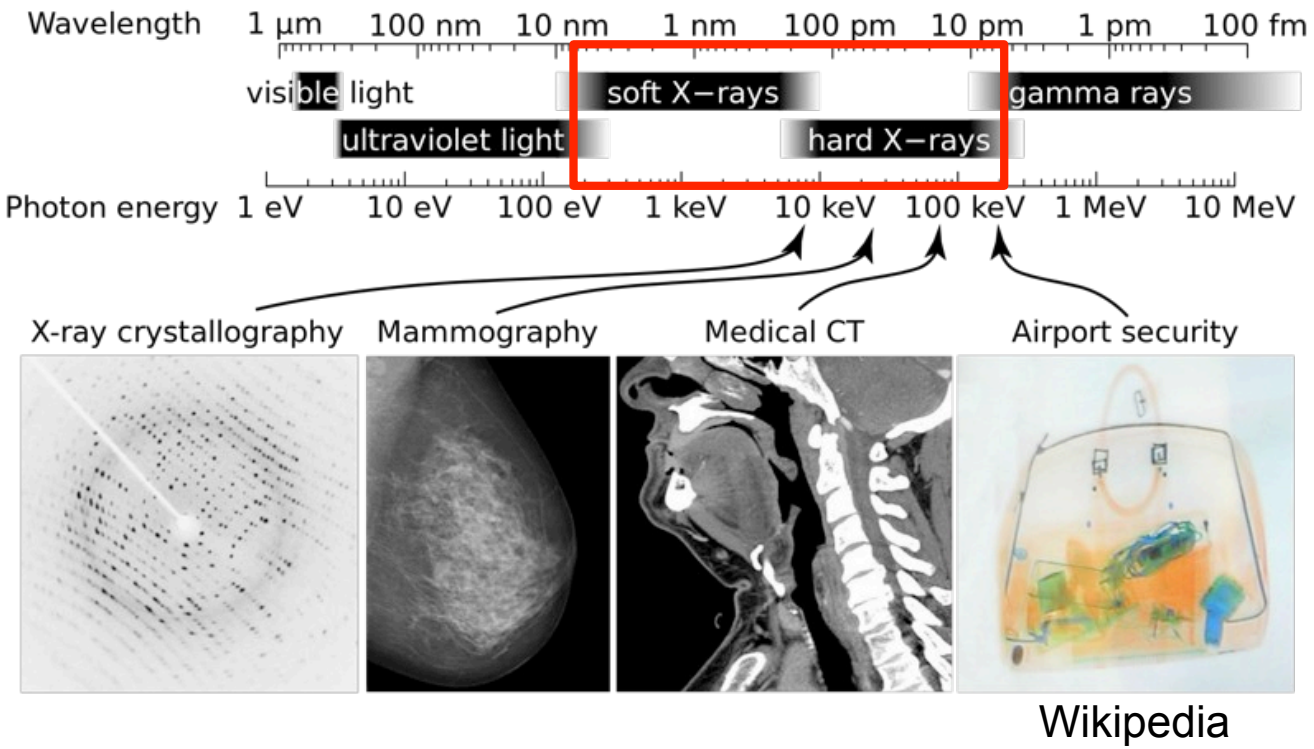
X-ray free-electron LASER



Wikipedia

X-rays: wavelength 0.1 – 100 Å

X-ray **free-electron** LASER

as opposed to electrons bound to an atom

X-ray free-electron **LASER**

Similar properties than optical Laser:

- high power
- narrow bandwidth (monochromatic)
- spatial coherence

X-ray free-electron LASER
=
XFEL

- 10 orders of magnitude higher peak brilliance than synchrotrons

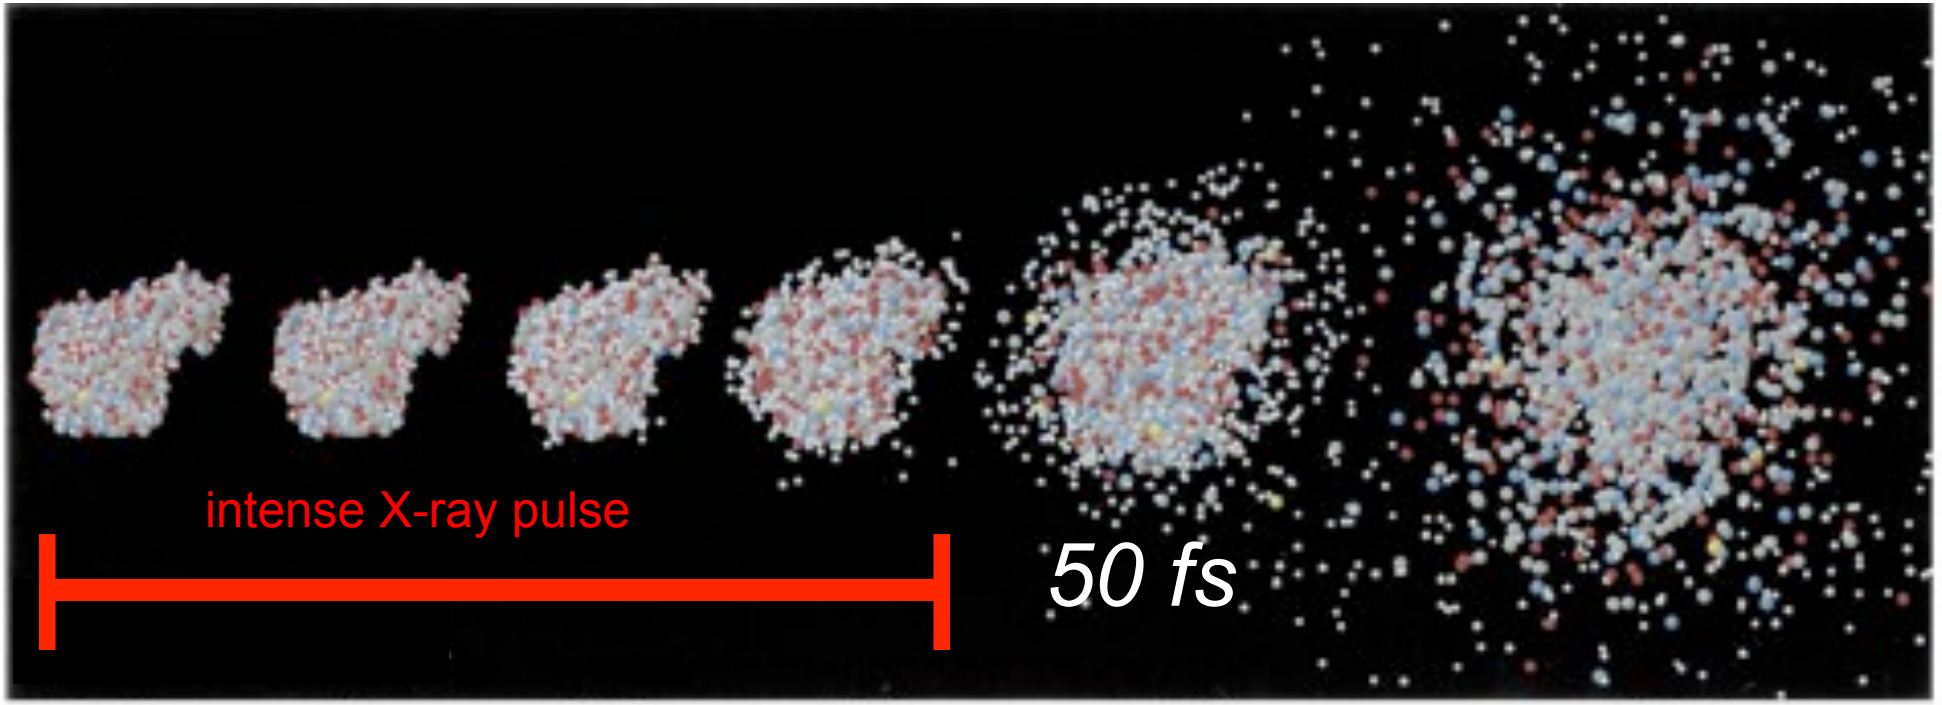
- short pulses (5 – 100 fs)

- repetition rate: 30 - 120 Hz (LCLS, SACLA, SwissFEL)
  27000 Hz (European XFEL)

- X-ray beam size : 100 nm – several microns

Diffraction-before-Destruction Imaging

Neutze et al. (2000) Nature 406, 7524



Promises of XFELs for Structural Biology:

- coherent diffraction imaging of single particles

(Review Miao et al. (2015) Science 348, 530)

- serial femtosecond crystallography (SFX)

(Review Schlichting (2015) IUCrJ 2)

Diffraction-before-Destruction Imaging

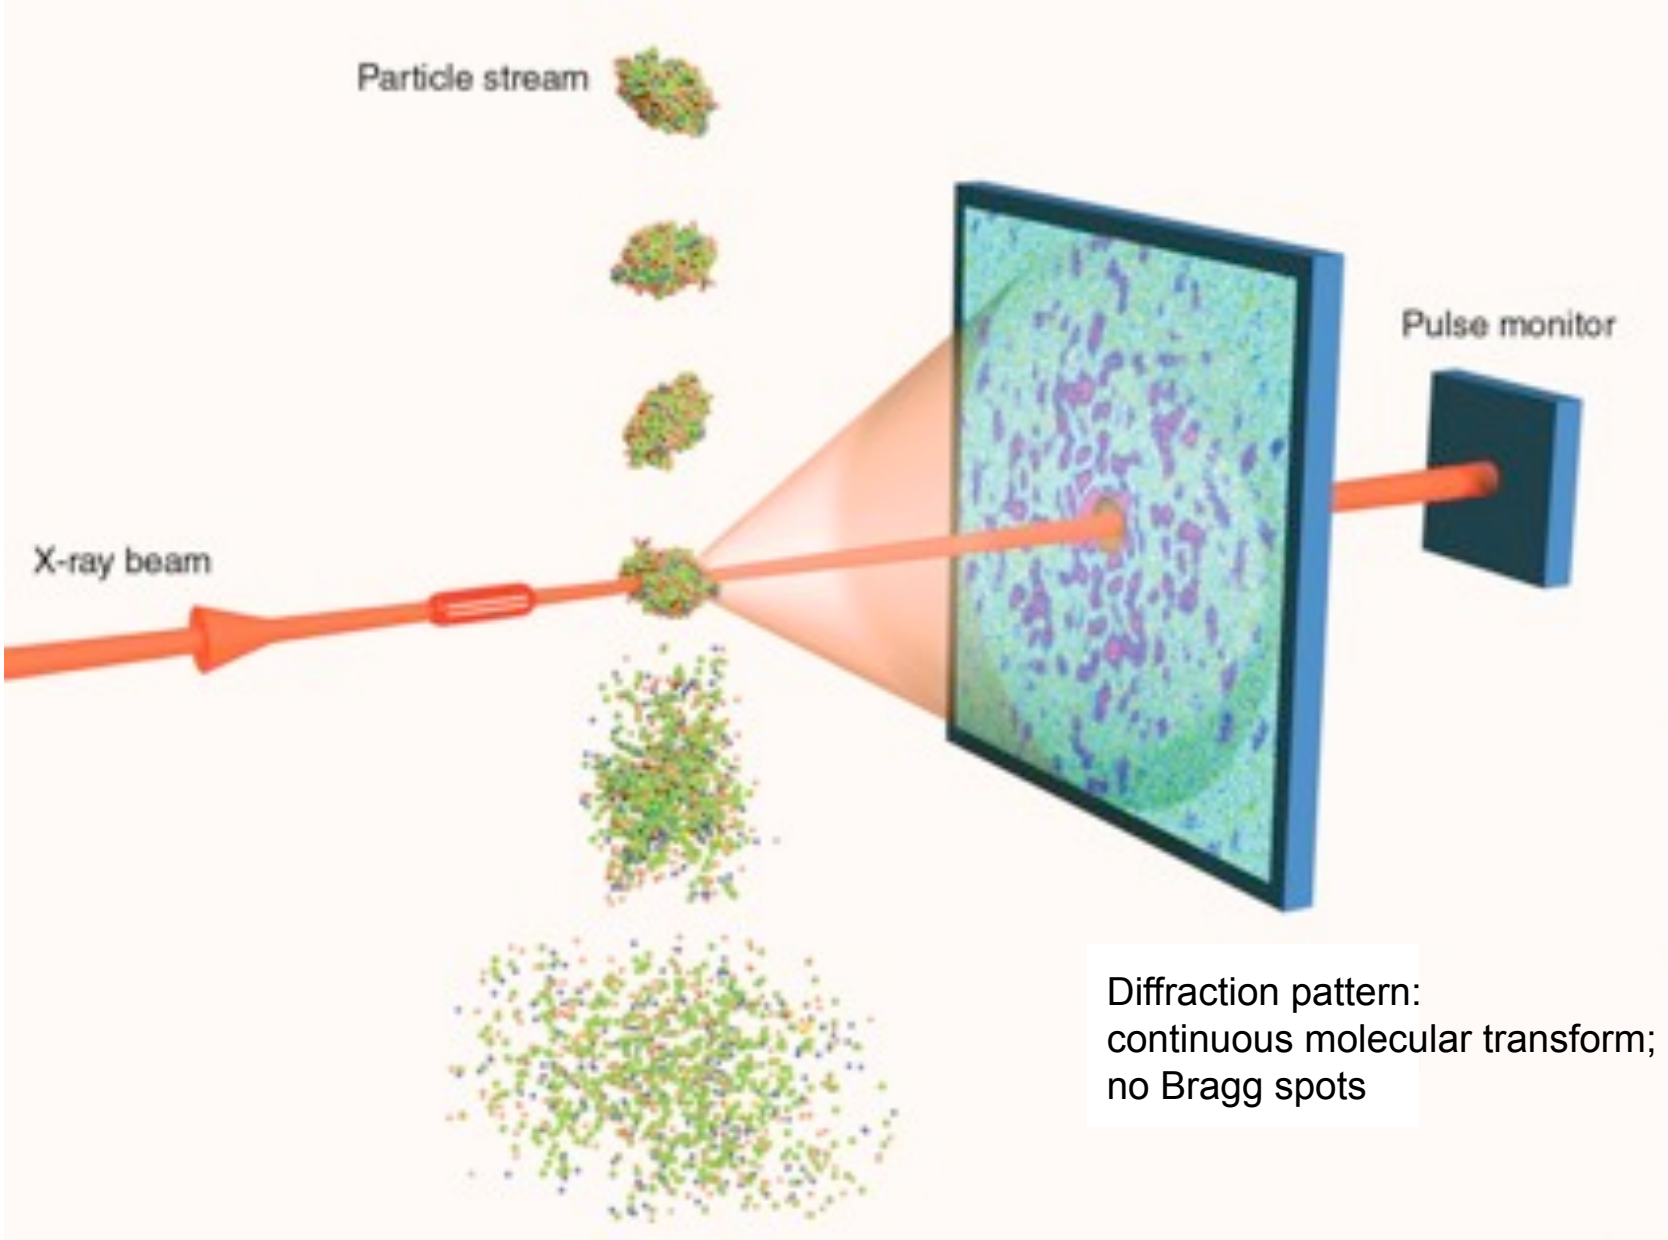


Image: Gaffney & Chapman (2007) Science 316, 1444

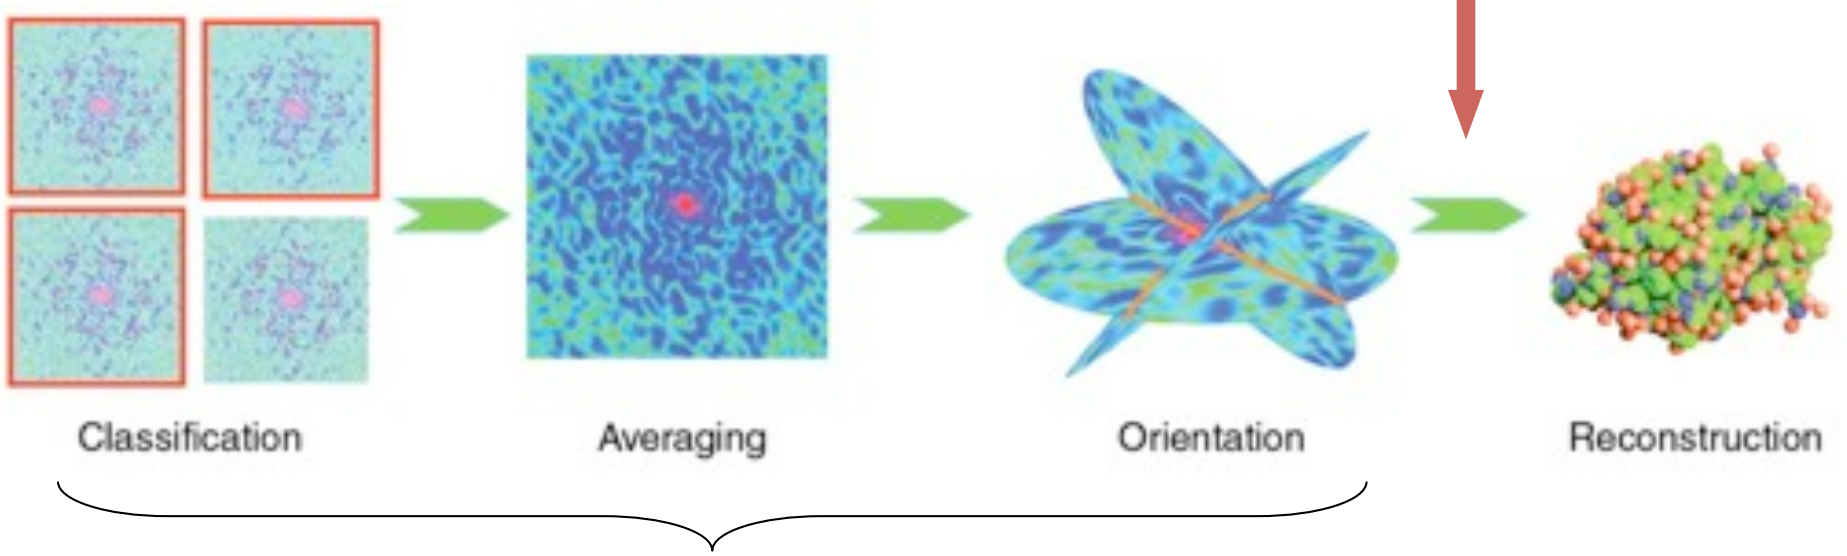
Diffraction-before-Distruction Imaging: data processing

Essential: Direct phase retrieval by the oversampling technique (Miao et al/ (2001) PNAS 98, 6641)

10^7 single shots necessary



Essential: Methods from single particle EM

Gaffney & Chapman (2007) Science 316, 1444

s

Coherent diffraction imaging on single molecules

using ultra-short intense XFEL pulses …

… limited today to molecules 1μm – 100 nm

(too small: hemoglobin: 5 nm; ribosome 25 nm)

< 100 nm: not enough X-ray flux

> 1μm : saturation of detector at low angle

Still science fiction: structure of single proteins (-complexes),

but OK for viruses (> 100 nm) at low resolution

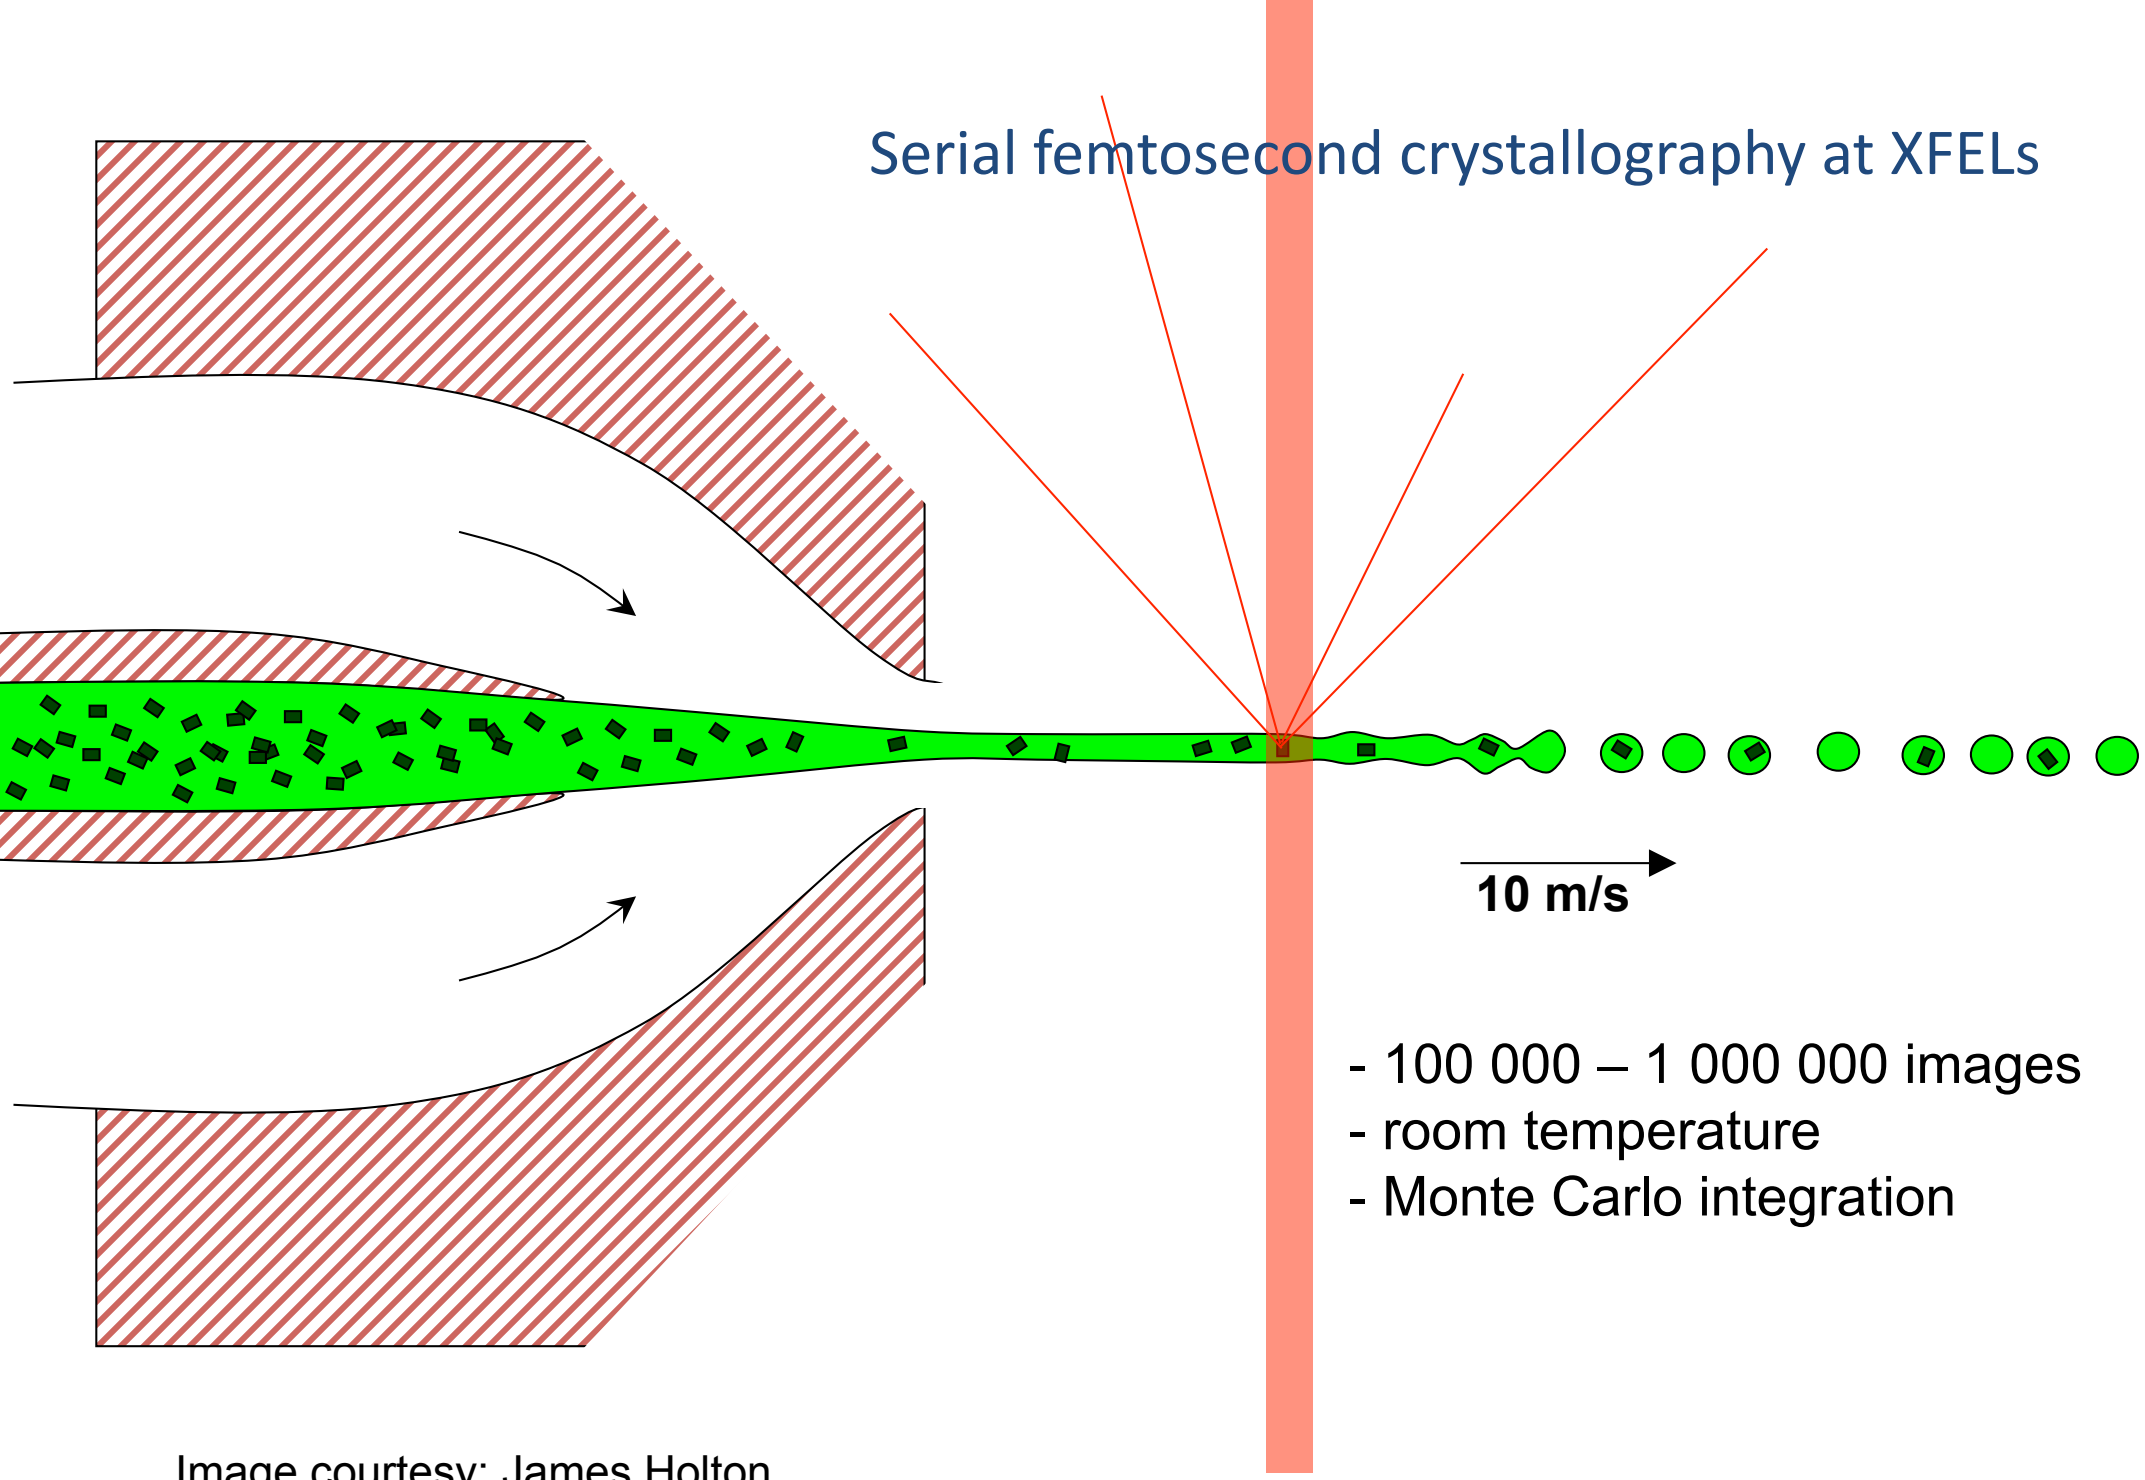
But :

Serial femtosecond crystallography (SFX)

using XFELs

shows great promise

Serial femtosecond crystallography at XFELs



- 100 000 – 1 000 000 images
- room temperature
- Monte Carlo integration

Van Thor,[11] John C. H. Spence,[3] Petra Fromme,[2] Henry N. Chapman,[6,7] Marius Schmidt[1]‡

Tenboer et al. (2014) Science 346, 1242

Novelty:

First time-resolved SFX (limited to nanoseconds)

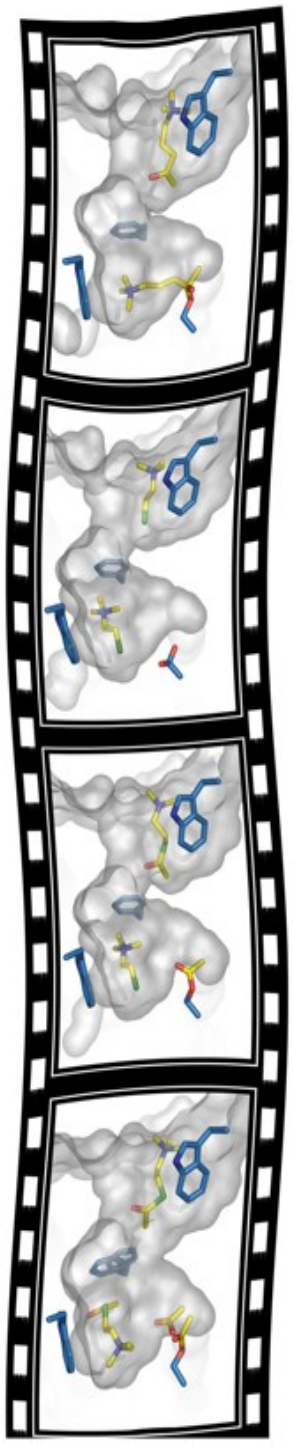
X

Pump laser XFEL

Image courtesy: James Holton

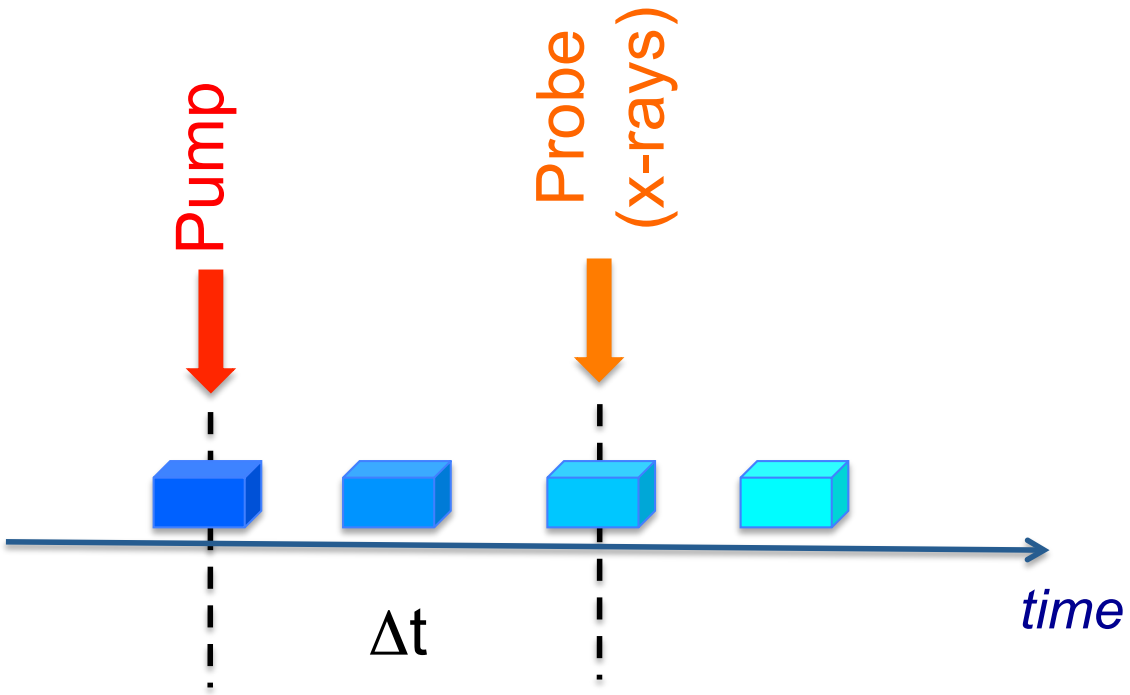
Time-resolved pump – probe crystallography: synchronization needed

Courtesy James Holton



Time-resolved crystallography: pump-probe

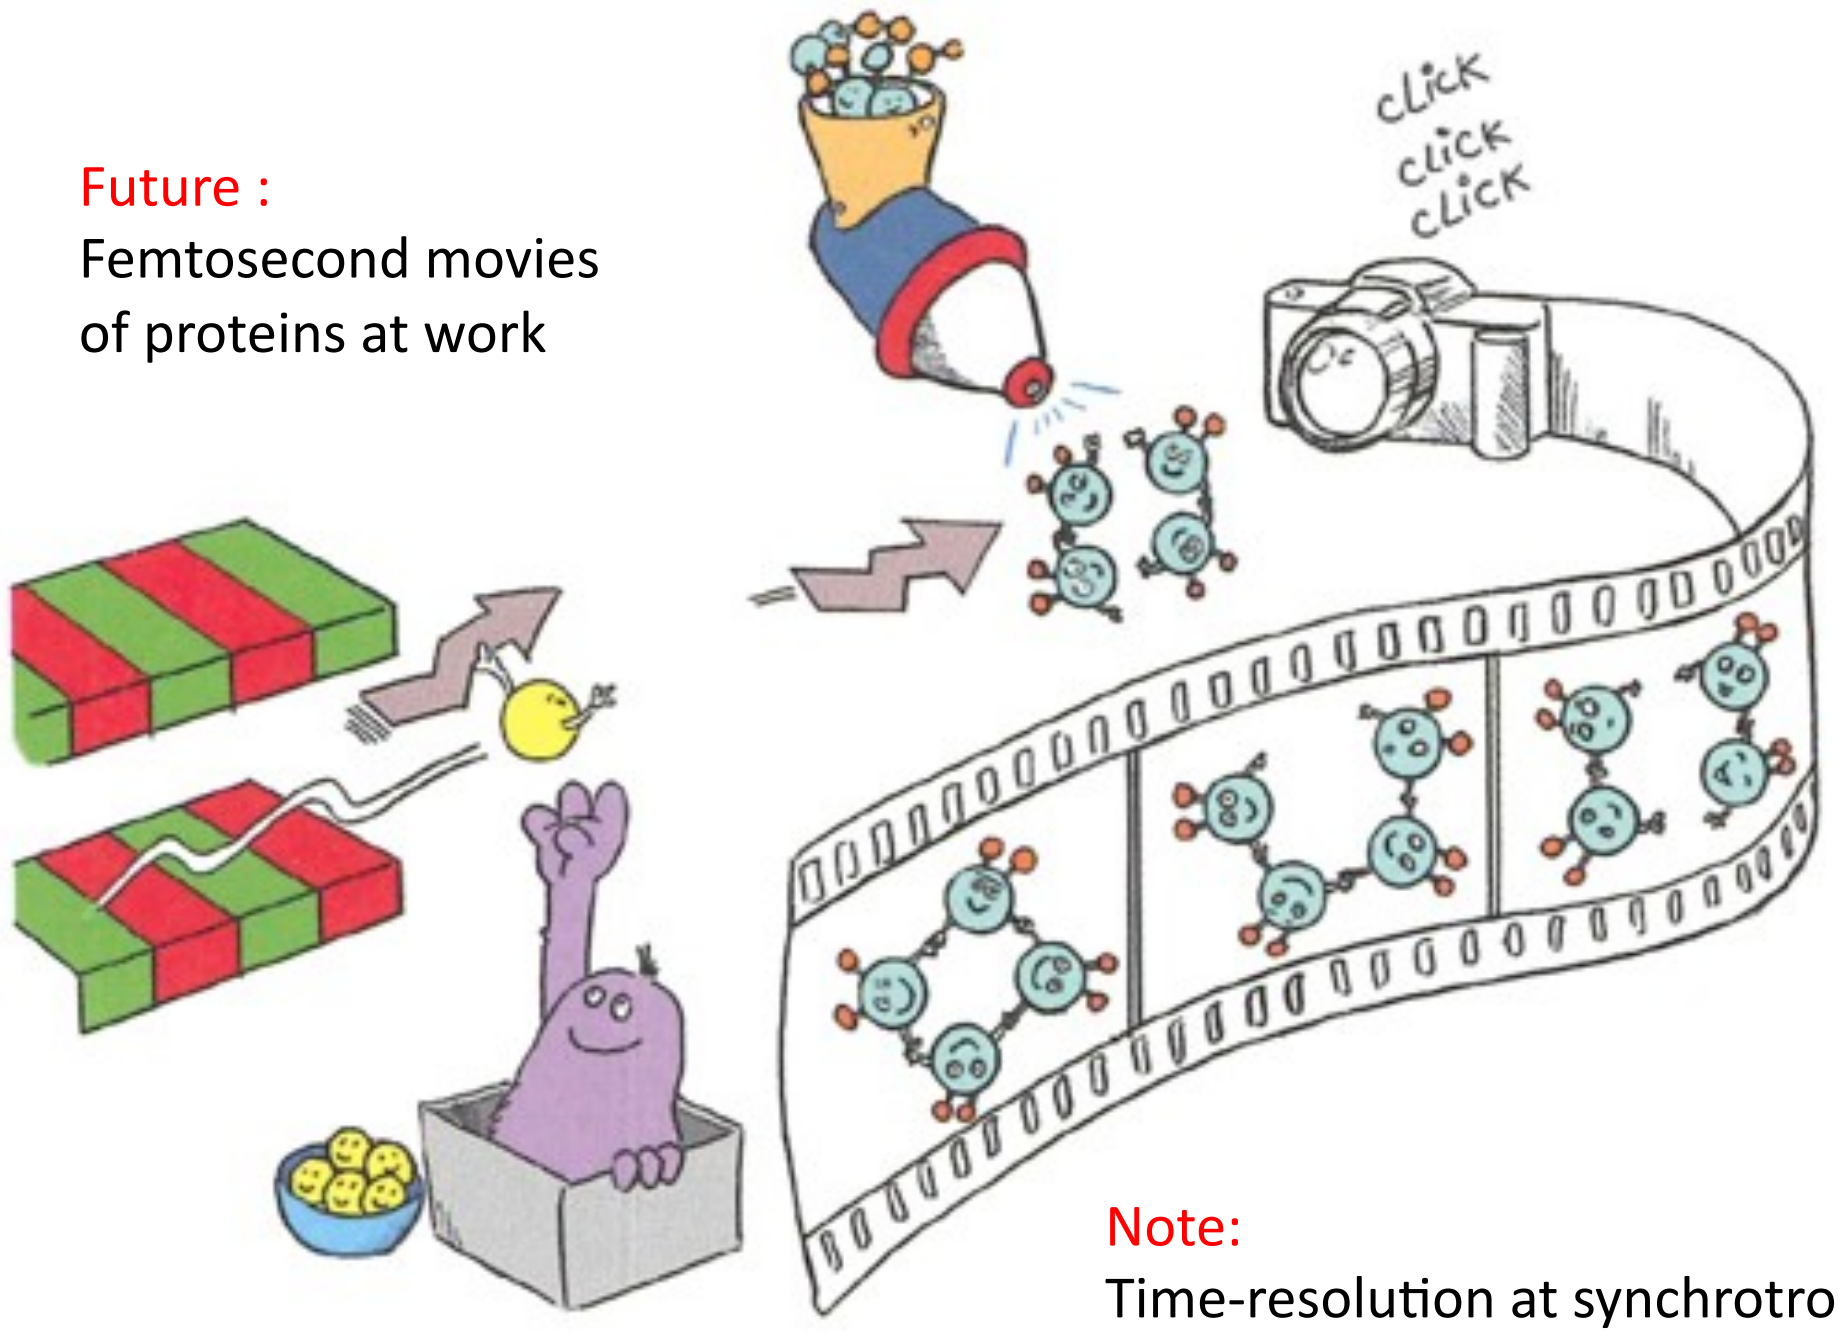
Aim: visualize structural changes in crystalline proteins
(e.g. enzymatic intermediate states)



Triggering (pump): - UV-vis light illumination
(inherent light sensitivity or caged compounds)
- diffusion of small molecules
- pH jump
- X-irradiation
- THz irradiation

Future :

Femtosecond movies of proteins at work



Note:

Time-resolution at synchrotrons limited to 100 ps

XFEL SFX – progress so far:

- SFX works - high resolution protein structures can be obtained

- micron-sized protein crystals can be used (macrocrystals are often very difficult to obtain)

- data collection at physiological (room) temperatures (100 K in most synchrotron experiments)

- de novo phasing is possible

- radiation-damage free protein structures can be determined

- proof-of-principle for time-resolved SFX

Challenges :

- generation and detection of protein microcrystals

- microcrystal injection

- protein sample consumption

- data processing (CrystFEL, cctbx.xfel): Monte Carlo integration, no estimate of partiality, requires lots of images

- phasing (only SAD with lanthanides worked so far – why ?)

- specific radiation damage still occurs (attenuate XFEL beam)

- time-resolved experiments faster than 1 ns

- BEAM TIME (only one beamline at LCLS and SACLA, cost: 400 kUSD per 12h)

Review:

- Microcrystals of fragile proteins (membrane proteins, protein complexes, …)
- *in vivo* crystallography
- Room temperature crystallography (preserves conformational heterogeneity)
- Damage-free structures of radiation sensitive proteins (metalloproteins, chromophore-containing proteins, …)
- Time-resolved experiments on ps-fs time sales

Summary

- single-protein CDI does not work (yet ?)
- SFX works and provides high-resolution protein structures
- 5 applications:
  - microcrystals
  - *in vivo* xtallo
  - room temperature
  - damage-free structures
  - femtosecond movies
- XFEL SFX and synchrotron crystallography are complementary
- French structural biology needs to catch the accelerating XFEL train
