

# Of Symmetry, Lattices & Space Groups

William SHEPARD

PROXIMA 2, Synchrotron SOLEIL

Gif-sur-Yvette, France

# What is Symmetry?

- Symmetry is all around us...
  - Just have a look...
- Examples
  - Mirror planes
  - Rotational axes
  - Repetitive motifs, i.e. Lattices
- Outline of Seminar
  - Symmetry Operators
  - Point groups
  - Lattices (2D & 3D)
  - Plane groups (2D)
  - Space groups (3D)
  - Reciprocal Space
  - Space Group Determination

# Basic Symmetry Operators

- Rotation axes
- Mirror planes
- Points of inversion
- Screw axes
- Glide planes
- Pseudo-symmetry

# Notation

- Schönflies
  - Rotational axes:  $C_1, C_2, C_3, \dots$
  - Mirror planes:  $S_1, C_{2v}, C_{3h}, \dots, D_4, D_{4h}, \dots$
  - C for cyclic, D for dihedral, S for *spiegel* (mirror)...
- Hermann-Mauguin
  - Rotational: 1, 2, 3, ...
  - Mirror planes: m, 4mmm, 2/m, ...
  - IUCr notation
- Others
  - Hall (1981)
    - Explicit
    - e.g. P 2y (= P2 or P 1 2 1 in Hermann-Mauguin)

# Asymmetry

Notation: 1 ( $C_1$ )

Equivalent positions:

1) x, y, z

# Mirror Symmetry

Equivalent positions:

- 1)  $x, y, z$
- 2)  $-x, y, z$

Notation:  $m$

( $S_1$  or  $C_s$ )

# Point of Inversion Symmetry

Equivalent positions:

1)  $x, y, z$

2)  $-x, -y, -z$

*Inverted hands  
catch in rugby*

Notation:  $\bar{1}$  ( $C_i$ )

*Pronounced « one-bar »*

# 2-fold Rotational Symmetry

Notation: 2

Equivalent positions:

1)  $x, y, z$

2)  $-x, -y, z$

# 2-fold Rotational Symmetry

Equivalent positions:

1)  $x, y, z$

2)  $-x, y, -z$

Notation: 2

# 3-fold Rotational Symmetry

Notation: 3

# 4-fold Rotational Symmetry

Equivalent positions:

- 1)  $x, y, z$     3)  $y, -x, z$
- 2)  $-x, -y, z$     4)  $-y, x, z$

Notation: 4

# 6-fold Rotational Symmetry

Notation: 6

# **POINT GROUPS (1D)**

# Point groups

- Definition:
  - Point groups define symmetry about a specified origin
  - The overall symmetry may combine more than one symmetry element

- Examples

- 2, 222, 4, 422,...
- mmm, 3m, 2/m,...

- Reciprocal space has a point group
  - The point group defines equivalent reflections

# Point Group 3m

Notation: 3m

# 3-fold Rotational Symmetry with Inversion

Notation:  $\bar{3}$

# 321 Point Group

Notation: 321

# 4mm point group

# Homework

- How many symmetry elements are there in a:

- Rugby ball?
- Tennis ball?
- Football?
- Shoe box?
- Cube?

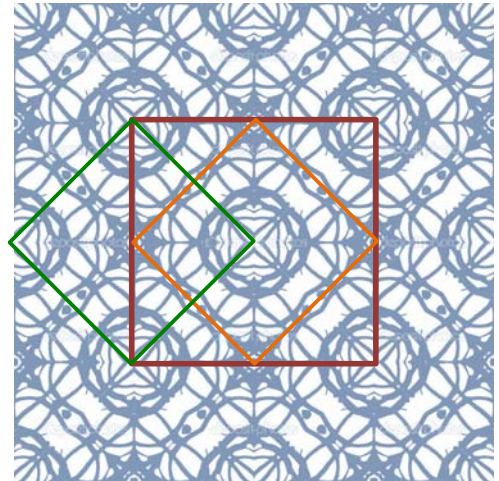

- Which point groups does each belong to?

# **LATTICES & PLANE GROUPS (2D)**

# Lattices

- Lattices are objects with a repetitive structure
  - The repetitive *unit*...
    - has a constant size & shape
    - may be formulated several ways
      - definition of the origin
      - centring
    - can reconstruct the entire object
    - may have symmetry elements
      - Rotational, mirror planes,...
      - glide planes & screw axes
- 2-dimensional lattices
  - Wallpaper, tiles & clothing
- 3-dimensional lattices
  - Packing, stacking & crystals

# 2D Bravais Lattices

- Oblique (Parallelogram)

–  $a \neq b, \alpha \neq 90^\circ$

- Rectangular

–  $a \neq b, \alpha = 90^\circ$

- Rhombic

–  $a = b, \alpha \neq 90^\circ$

- Hexagonal

–  $a = b, \alpha = 120^\circ$

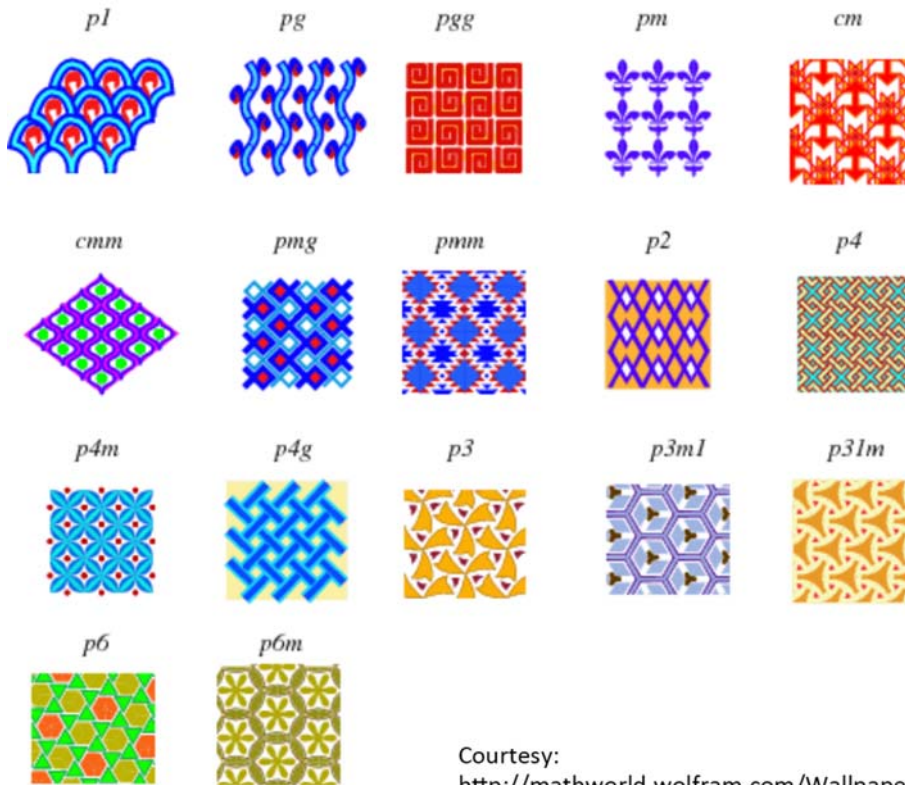

- Square

–  $a = b, \alpha = 90^\circ$

# Plane groups (17)

Courtesy:  
<http://mathworld.wolfram.com/WallpaperGroups.html>

# Glide planes

- Mirror plane with translation
  - Translation defined as:
    - along mirror plane
    - $\frac{1}{2}$  unit cell length
- Notation (Herman-Mauguin)
  - 2D: g (glide)
  - 3D: a, b, c, n, e, d
    - a = glide along a-axis of unit cell
- Symbol
  - Right angle arrow
- Common in small molecule crystallography
  - But non-existent for protein/DNA/ RNA crystallography...

# Centring

- Which unit cell would you choose? Why?

# **3D LATTICES & SPACE GROUPS**

# 3D Bravais Lattices

- 14 Bravais Lattices
- 7 Lattice Systems
  - Triclinic ( $a \neq b \neq c, \alpha \neq \beta \neq \gamma \neq 90^\circ$ )
  - Monoclinic
  - Orthorhombic
  - Tetragonal
  - Rhombohedral/trigonal
  - Hexagonal
  - Cubic
- Centering
  - Primitive (P)
  - Axis centered (A,B,C)
  - Body-centered (I)
    - German *Innenzentriert*
  - Face-centered (F)
  - Rhombohedral (R)

# 3D Space Groups

- 230 Space groups
  - 65 Sohncke or non-centrosymmetric space groups
    - chiral molecules (i.e. protein, DNA, RNA,...)
- IUCr International Tables Vol. A
  - The « bible » for crystallographers!
  - ...which is out of print... but exists in PDF format
- <http://img.chem.ucl.ac.uk/sgp/large/sgp.htm>
  - Very convenient web site!
  - Jeremy Karl Cockcroft

# Space Group Notation

$I4_322$

- Always starts with the type of **centering**
  - Always a CAPITAL letter for 3D space
  - P, (A, B), C, I, F or R (Hermann Mauguin notation)
- Followed by **symmetry elements**
  - Rotation/Screw axes
    - 2, 3, 4, 6 or  $2_1, 3_1, 3_2, 4_1, 4_2, 4_3, 6_1, 6_2, 6_3, 6_4, 6_5$
  - Mirrors, glide planes & centers of inversion
    - m, a, b, c, n, d, (e) and/or a number with a « bar » over it
    - e.g.  $\bar{3}$ , pronounced « three-bar »
- Long and short notations
  - $P2_1$  and P 1  $2_1$  1

Space Group Names

Equivalent  
Positions

1  $x, y, z$

2  $\bar{x}, y, \bar{z}$

$O^+$  &  $O^-$  represent  
"asymmetric units"

Space group diagram

$O^+$  above page

$O^-$  below page

# Asymmetric Unit (ASU)

- The asymmetric unit (shaded yellow or green) of a space group is the fractional volume that contains no crystallographic symmetry
  - ASU volume =  $1/N$ , where  $N$  = number of equivalent positions in the space group
  - The ASU is represented by a single  $O^+$  sign in the space group diagram
- The ASU may contain more than 1 molecule
  - Non-Crystallographic Symmetry (NCS)
  - Beware: NCS is fairly common in MX!

$P\bar{1}$

$P\bar{1}$

$\bar{1}$

No. 2

Pronounced "P 1 bar"

1  $x, y, z$

2  $\bar{x}, \bar{y}, \bar{z}$

A comma indicates the opposite chiral hand

$P222$

$P 2 2 2$

$222$

No. 16

1  $x, y, z$

2  $x, \bar{y}, \bar{z}$

3  $\bar{x}, y, \bar{z}$

4  $\bar{x}, \bar{y}, z$

# Screw axes

- 2-fold screw axis
  - Rotate  $180^\circ$
  - Translate  $\frac{1}{2}$  unit cell length
  - Notation:  $2_1$
- 3-fold screw axes
  - Rotate  $+120^\circ$  or  $-120^\circ$
  - Translate  $+\frac{1}{3}$  or  $-\frac{1}{3}$  unit cell length
  - Notation:  $3_1, 3_2$
- 4-fold
  - Rotate  $\pm 90^\circ$  or  $180^\circ$
  - Translate  $\pm\frac{1}{4}, +\frac{1}{2}$  unit cell length
  - Notation:  $4_1, 4_2, 4_3$
- 6-fold
  - Rotate  $\pm 60^\circ, \pm 120^\circ$  or  $180^\circ$
  - Translate  $\pm\frac{1}{6}, \pm\frac{1}{3}, +\frac{1}{2}$  unit cell length
  - Notation:  $6_1, 6_2, 6_3, 6_4, 6_5$
- Enantiomorphic pairs
  - $\{3_1|3_2\}, \{4_1|4_3\}, \{6_1|6_5\}, \{6_2|6_4\}$

+  $(\frac{1}{2}, \frac{1}{2}, 0)$

# **PSEUDO-SYMMETRY**

# Pseudo-symmetry

- Lots and lots...

- Especially when things don't quite fit right together...  
Like biological macromolecules!
  - e.g. Hemoglobin  $\alpha_2\beta_2$
  - Non-Crystallographic Symmetry (NCS) very common
    - More than one molecule in the asymmetric unit

# 2D Pseudo-symmetry

www.shutterstock.com · 89394439

# Pseudo-Symmetry & Unit Cells

- Some lower symmetry unit cells may look like higher symmetry ones, e.g.
  - Monoclinic unit cells with  $\beta \approx 90^\circ$  may index as an orthorhombic unit cell
  - An orthorhombic unit cell with  $a \approx b$  may index as a tetragonal unit cell
- Examine the output of the next slide
  - $a \approx b \approx c$
  - In fact the protein displays « polymorphism » and crystallises into more than one crystal form (unit cell)

# Indexing & Space Groups

Possible solutions

Possible polymorphism?  
- Proteins may crystallise  
in more than one lattice  
and space group

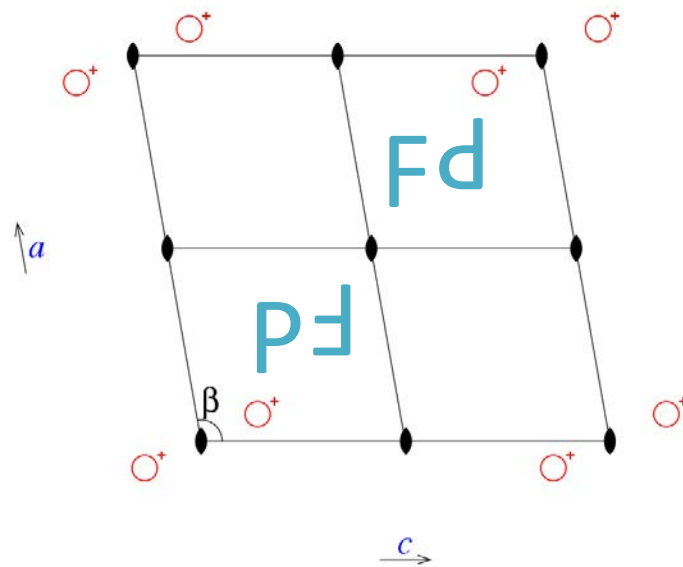

# Non-Crystallographic Symmetry (NCS)

$P2$

$P121$

$2$

EXTRA!

- The above example illustrates NCS
- The P and F resemble each other, and they pack along a pseudo 2-fold axis
- The real space group is  $P2$  with 2 *slightly different* molecules in the ASU

# Intermission?

- Next up...
  - Real Space and Reciprocal Space
  - Space Group Determination

# Real Space & Reciprocal Space?

- Reciprocal Space is an abstract concept that explains diffraction...
- It is a relationship between the lattice planes of a crystal in real space, and their corresponding diffraction points generated by Reciprocal Space...
- It also applies to 1D and 2D « crystals »
  - which are easier to visualise and understand...

# Young's Experiment (1803) Revisited

# Reciprocity & 1D Reciprocal Space

- Consider the multiple atom experiment
- A smaller spacing ( $x$ ) between slits or atoms in the lattice yields...
  - a larger separation between diffraction spots ( $1/x$ )
    - Each diffraction spot has its own Miller index, ( $h$ )
    - Each Miller index represents a vector in real space, [ $h$ ]

# Reciprocal space of a grid

# 1D, 2D & 3D Reciprocal Space

1D  
Lattice points  
[h]  
Unit Spacing = a

2D  
Lattice lines  
[hk]  
Unit cell constants =  
a, b &  $\alpha$

3D  
Lattice planes  
[hkl]  
Unit cell constants =  
a, b, c,  $\alpha$ ,  $\beta$ ,  $\gamma$

# 3D Reciprocal Space

- Lattice planes in Real Space become points in Reciprocal Space

# Space Group Determination

- So you have crystals & crystallographic data
  - Congratulations!
  - Now the fun begins...!
- Q: How to determine its space group?
  - 1) Determine the *Bravais Lattice*
  - 2) Determine the *Laue Class*
  - 3) Look for *Systematic Absences*
  - 4) Check for *Enantiomorphic Space Groups*
  - 5) Check *IUCr Conventions*
  - 6) Verify *Equivalent Indexing Solutions*
  - 7) Verify the *Choice of Origin*

# Space Group Notation

# Bravais (3D) Lattices

- 14 Bravais Lattices
- 7 Lattice Systems
  - Triclinic (*a* for *anorthic*)
    - $a \neq b \neq c, \alpha \neq \beta \neq \gamma \neq 90^\circ$
  - Monoclinic (*m*)
    - $a \neq b \neq c, \alpha = \gamma = 90^\circ \neq \beta$
  - Orthorhombic (*o*)
    - $a \neq b \neq c, \alpha = \beta = \gamma = 90^\circ$
  - Tetragonal (*t*)
    - $a = b \neq c, \alpha = \beta = \gamma = 90^\circ$
  - Trigonal / Rhombohedral (*h*)
    - Trigonal  $a = b \neq c, \alpha = \beta = 90^\circ, \gamma = 120^\circ$
    - Rhombahedral  $a = b = c, \alpha = \beta = \gamma \neq 90^\circ$
  - Hexagonal (*h*)
    - $a = b \neq c, \alpha = \beta = 90^\circ, \gamma = 120^\circ$
  - Cubic (*c*)
    - $a = b = c, \alpha = \beta = \gamma = 90^\circ$
- Centering
  - Primitive (P)
  - Axis centered (A,B,C)
  - Body-centered (I)
    - German *Innenzentriert*
  - Face-centered (F)
  - Rhombohedral (R)

Where « ≠ » means not necessarily equal to

# Which Bravais Lattice in Real Space?

- What is a Unit Cell?
  - Smallest *unique repeating unit* of a crystal
  - Many possibilities... but only one ***reduced cell***... which ***transforms*** to other cells
  - The final choice should obey IUCr conventions (i.e. rules)
    - → cube-like unit cell
    - Preference for  $\alpha, \beta, \gamma = 90^\circ$ 
      - $\alpha, \beta, \gamma > 90^\circ$
    - $a < b < c$ , except for unique symmetry axes

# Find Spots & Index

- Find strong spots
  - $X_{\text{det}}, Y_{\text{det}}, \omega$  (angle)
- Convert spot positions to reciprocal space
- Calculate a ***reduced*** unit cell and its transformations:
  - $a, b, c, \alpha, \beta, \gamma$
- Assign a Miller indice (h,k,l) to each spot

# Which Bravais Lattice in Reciprocal Space?

- Look at this diffraction pattern
  - obviously we prefer:  
 $\alpha, \beta, \gamma = 90^\circ$
- NOTE: Miller Indices (h,k,l) must be integers!
- Note: Centered Lattices will have *systematic absences*
  - C-centered:  $h+k = 2n$
  - I-centered:  $h+k+l = 2n$

# Example: Indexing & Space Groups

38	oC	250.5	98.5	229.2	106.3	90.0	90.0	87.2
29	mC	250.5	98.5	229.2	106.3	90.0	90.0	87.2
28	mC	250.6	98.5	234.3	106.3	90.0	90.0	87.2
36	oC	250.7	98.5	234.3	106.3	90.0	90.0	87.2
41	mC	275.4	236.4	103.5	106.3	90.0	90.0	87.2
30	mC	275.4	103.5	236.4	106.3	90.0	90.0	87.2
40	oC	275.4	103.5	236.4	106.3	90.0	90.0	87.2

Possible solutions:

- All likely, because  $\beta = 90^\circ$  for monoclinic unit cell (for example)
- Usually we select the solution with the highest symmetry, but BEWARE the correct unit cell could have lower symmetry
- CAUTION: The quality of fit depends strongly on correct experimental parameters:
  - Distance
  - X-ray wavelength
  - Beam center
  - tilt & twist of detector

# Friedel's Law (1913)

$$E(hkl) = f_1 + f_2 + f_3 + f_4 + f_5 + f_6 + f_7$$

Front to back direction

$$E(-h -k -l) = -f_7 - f_6 - f_5 - f_4 - f_3 - f_2 - f_1$$

Back to front direction

$$|F(h, k, l)|^2 = I(h, k, l)$$

$$|F(h, k, l)| = |F(-h, -k, -l)|$$

$$I(h, k, l) = I(-h, -k, -l)$$

Diffraction adds a symmetry of inversion!

# Point Group & Laue Class

Point Group 1  
 $[x, y, z]$

Laue Class  $\bar{1}$   
 $hkl = \bar{h}\bar{k}\bar{l}$

222222  
 222222  
 222222  
 222222  
 222222

Point Group 2  
 $[x, y, z], [-x, y, -z]$

Laue Class  $2/m$   
 $hkl = \bar{h}k\bar{l} = h\bar{k}l = \bar{h}k\bar{l}$

# Point Group & Laue Class

Table 3.1.2.1. *Laue classes and crystal systems*

Laue class	Crystal system	Conditions imposed on cell geometry
$\bar{1}$	Triclinic	None
$2/m$	Monoclinic	$\alpha = \gamma = 90^\circ$ ( $b$ unique) $\alpha = \beta = 90^\circ$ ( $c$ unique)
$mmm$	Orthorhombic	$\alpha = \beta = \gamma = 90^\circ$
$4/m$ $4/mmm$	Tetragonal	$a = b; \alpha = \beta = \gamma = 90^\circ$

# Reflection Conditions & Systematic Absences

- Certain symmetry operators generate **reflection conditions**, also known as **systematic absences**
- The structure factors (intensities) of the atomic positions generated by these symmetry operators **cancel out** for certain **families of reflections** (e.g. 00l)
  - Example  $C222_1$ 
    - Reflection conditions
    - hkl :  $h+k = 2n$
    - 00l:  $k = 2n$

$F(0k0) = 0$  for  $k = 2n+1$ , and is **systematically absent for  $k = \text{odd numbers}$**

# Equivalent Positions & Systematic Absences

$P2_12_12_1$

$P 2_1 2_1 2_1$

$222$

No. 19

1  $x, y, z$

2  $\frac{1}{2} + x, \frac{1}{2} - y, \bar{z}$

3  $\bar{x}, \frac{1}{2} + y, \frac{1}{2} - z$

$P2_12_12_1$

Symmetry Operators

1 $x, y, z$	1
2 $\frac{1}{2} + x, \frac{1}{2} - y, \bar{z}$	$2_1 (x, \frac{1}{4}, 0) [\frac{1}{2}, 0, 0]$
3 $\bar{x}, \frac{1}{2} + y, \frac{1}{2} - z$	$2_1 (0, y, \frac{1}{4}) [0, \frac{1}{2}, 0]$
4 $\frac{1}{2} - x, \bar{y}, \frac{1}{2} + z$	$2_1 (\frac{1}{4}, 0, z) [0, 0, \frac{1}{2}]$

No. 19

Reflection Conditions

(general)

$h00 : h = 2n$

$0k0 : k = 2n$

$00l : l = 2n$

# Systematic Absences

- Centering
  - C-centering, hkl:  $h+k = 2n$
  - I-centering, hkl:  $h+k+l = 2n$
  - F-centering, hkl:  $h+k, h+l, k+l = 2n$
- Screw Axes
  - $2_1$  or  $4_2$  or  $6_3$  along a-axis
    - h00:  $h = 2n$
  - $3_1$  or  $3_2$  or  $6_2$  or  $6_4$  along a-axis
    - h00:  $h = 3n$
  - $4_1$  or  $4_3$  along a-axis
    - h00:  $h = 4n$
  - $6_1$  or  $6_5$  along a-axis
    - h00:  $h = 6n$
- Rhombohedral lattices
  - For example R3
    - hkil:  $-h+k+l = 3n$  (hexagonal axes) or
    - hkl: none (rhombohedral axes)
- Glide planes (centrosymmetric space groups)
  - c-glide for space group Pc (monoclinic No.7)
    - h0l:  $l = 2n$
  - etc...

# Enantiomorphous Space Groups

- Certain space groups are enantiomorphs and are *indistinguishable*, because the diffraction experiment adds a symmetry of inversion

- $P3_1$  and  $P3_2$
- $P4_1$  and  $P4_3$
- $P6_1$  and  $P6_5$
- $P6_2$  and  $P6_4$
- $P6_1$  and  $P6_5$
- $P4_122$  and  $P4_322$
- $P4_12_12$  and  $P4_32_12$
- $P3_112$  and  $P3_212$
- $P3_121$  and  $P3_221$
- $P6_122$  and  $P6_522$
- etc...

- The only way to distinguish them is to solve the structure!

# Some IUCr Conventions

- Axes form right-handed system
- Prefer C-centering rather than A- or B-centering
- Unique angles should be close to 90° and obtuse
  - For monoclinic  $\beta > 90^\circ$
- Axial lengths in increasing order
  - $a < b < c$
- Placement of unique symmetry operator?
  - $P2_12_12$  or  $P22_12_1$  or  $P2_122_1$ ?
  - $P2_122$  or  $P222_1$ ?
  - Human Transthyretin
    - $P2_12_12$ ,  $a = 43.21\text{\AA}$   $b = 85.99\text{\AA}$   $c = 63.82\text{\AA}$

# Indexing & Equivalent Solutions

Figure 23  
Two ways of indexing the tetragonal lattice in point group 4, with the fourfold axis directed 'up' or 'down'. These two ways are not equivalent, since reflections with the same indices will have different intensities. In this case the symmetry of reflection positions (lattice) is higher than the symmetry of their intensities.

- Caution!
  - Certain space groups have equivalent indexing solutions
  - Where axes can be swapped
    - Tetragonal
    - Trigonal
    - Hexagonal
    - Cubic
  - Experiments that merge data sets together need to verify the indexing solutions for each data set
    - S-SAD, MAD, Serial MX,...

Dauter (1999)
